To his GRACE

## CHARLES

DUKE of Shrewsbury,

Lord-Chamberlain of His Majesty's Houshold, Lord-Lieutenant of the County of Worcester, One of the Lords of His Majesty's most Honourable Privy-Council, and Knight of the most Noble Order of the Garter.

May it please your GRACE,

HEN I fought the Opportunity of a Dedication, to return Thanks for the Fa-

vours I had receiv'd from your

A 2 GRACE,

hi

GRACE, I cannot say my Gratitude was entirely divested of Self-Interest; for I imagin'd (as I have a fince experienc'd) that your Princely Patronage to this Treatife, would procure it a more favourable Reception in the World, than I could Z pretend due to any Deserts of its to Author; and the Liberty you G most obligingly gave me, of pub- ki lishing therein the great Honour T I have of being related to, and p patroniz'd by your GRACE, has in prov'd a Recommendation of me se to Multitudes, who depend upon, Moor court your Favour. As to divulge those generous Acts your ar GRACE industriously conceals, hi would be to offend your Modesty; su fo to be entirely filent in what at relates to your Glory, which every be Body else proclaims, would leave do room

room for a Suspition of Ingrati-tude in him, whose Inclinations and Judgment have ever made the utmost Acknowledgment of Obligations, one of the most essential Duties of his Life: Yet tho' my Zeal for your Glory be second to none, I shall not attempt your u GRACE's Panegyrick, because I know my felf much unequal to the Task; but only beg Leave to exd press the Satisfaction I have in being a daily Witness of that dee serv'd Applause, your Conduct, n, Moderation, and consummate Wisi-dom, receive from all Mankind; ar and to congratulate you upon those ls, high Dignities, by which so many signification sovereigns have at attested your Merits. We have ry beheld you honour'd with a Dukeve dom, with a Knighthood of the m

most Noble Order of the Garter, twice with the important Trust of Principal Secretary of State, with the Dignity of Ambassador extraordinary to France, and very lately loaded (I may justly give it that Term, when you your self thought it so) with so many and so great Employments and Honours, as no other Subject ever enjoy'd together fince the Foundation of this Monarchy; for you were at once Lord High-Treasurer of Great-Britain, Lord Lieutenant-General, and General - Governor of the Kingdom of Ireland; Lord-Chamberlain of the Houshold, Lord-Lieutenant of the Counties of Salop and Worcester, one of the Lords of the most Honourable Privy-Council, and one of the Lords Justices of all his Majesty's But Dominions.

But how glorious soever you appear'd to us under so many Honours, that disinterested Greatness of Soul with which you withdrew your self from those highest Preferments, and greatest Advantages, at a Time your King and Country were most earnest for your Continuance in them, has given this, and will leave to suture Ages, a far nobler Idea of your Mind, and a more transcendent Character of your Moderation and Virtue.

That your GRACE may live long in full Content, and perfect Health, always esteem'd and favour'd by your Sovereign, belov'd by your Equals, respected and honour'd by your Inferiors, and that the Fame of your Wisdom

dom may be transmitted down to the latest Posterity, are the Wishes of

Your GRACE's

Most Oblig'd,

And

Most Devoted Servant,

John Purcell.

## PREFACE.

THO it be customary for Authors to prefix a Preface to what they publish, thereby to lead their Readers into the Scope and Drift of the Work, I thought this Book needed none, nor had I made any, but to obviate some few Objections.

The first is, that I have made this Distemper intricate, and depending upon a Multitude of different ('auses, which appear'd easie before, and was deliver'd to us by the ingenious Willis, and many other learned Men, as occasion'd by two or three different ones only: But I am humbly of Opinion that I have not multiply d the Causes of the Cholick without necessity, nor even without sufficient Proofs and Authority for each particular one assign'd: And what induc'd me first to undertake this Work was, that I objere'd many different Caules of the Cholick instanced by various Authors, which were no where to be found together in any one.

Tho' I believe no Graduate Physician is ignorant of any of them, yet as the Multitude of Quacks and Pretenders to Physick, with which this Nation swarms, imagin that all Cholicks proceed from the same Cause, and ignorantly pretend to cure them all with one Medicine; I would endeavour by representing the Intricacy and various Causes of this Distemper, to convince their Patients how grosly they are abus'd, and to what imminent Danger they expose their own Lives by trusting to them. I believe there is not one of the Faculty I have the Honour to be a Member of, who will think any Labour or Scrutiny too nice and great, where the Nature of the Distemper, and the Preservation of the Life of his Patient requires it, but if there should be one such among us, to him I flatter my self, this small Performance will prove the most acceptable, because he will not only find here in a few Pages, what must have taken him up Months to have collected from different Authors, but also some manner of Care ready at hand for each particular Cause.

Another

Another Objection is, That I have brought several Distempers under this Head, as Inflamations of the Liver and Spleen, Imposthumes, Ulcers, Cancers. Tumours, Worms, &c. which are treated of by all other Authors as distinct Distempers from the Cholick. To which I reply, that all and each of these Causes, when seated in the Lowerbelly, frequently occasion violent Pains therein, which from a simular Sense of Pain are often mistaken for the Cholick, under which Denomination they generally and not improperly pass, 'till their Symptoms arising to a height manifestly denote the true Causes; after which I would no longer stile them Cholicks, but range them under their proper Heads.

It is thirdly objected, That violent Pains in the Stomach, tho' they may be of the same Nature with those felt in the Guts during the Cholick, ought not to be term'd Cholical, because that Appellation is only proper to what are seased in the Colon. This is disputing upon Words only, for if Cholical is agreed to be derived from xãxov, the Objection is granted: but if from nonaled to torture, it is as

9

t

l-

6

08

89

applicable

applicable to any other Part, as to the Guts: And are not Pains of the Gravel, term'd the Nephretick Cholick, tho seated in the Kidneys or Vreters? It is farther alledg'd that as most Authors, particularly Riverius, (a) stile a Pain in the Stomach Dolor Ventriculi and not Colica, I ought not to vary from the ulual and receiv'd Denominations of Diseases: To which I answer, that the same Riverius in another place (b) calls it Colica Ventriculi himself; and that the Cholick in the Stomach, is grown the most usual Appellation of it among st Physicians and others, especially in England.

I fully design'd to have added to this Treatise, the entire Processes of one or two Cures of the Cholick arising from each particular Cause, that has occurred in my Practice; but three things hinder'd me from doing it; the first was, That some of my Patients were unwilling to have their Names appear in print

033

Lazarus Riverius Praxeos Lib. IX. Cap. 10

on this Account; without which the truth of those Cures might have been questioned. The second, that several of those Cures were perform'd in Conjunction and Consultation with some of the most eminent Physicians in London, with whom I have not yet had sufficient opportunity to settle them all; and I was unwilling to publish what they had the greatest Share in, without doing them entire Justice. Which tho' I am at present debarr'd from in this way, nothing shall ever hinder me from acknowledging the Obligations I have to that most learned Body of Physicians, who have deservedly the Fame of being the Ablest in the World; from extolling their most excellent Practice of that Art, which they have brought to a Perfection not to be parallel'd in any other Place of the Universe; nor fromreturning due Thanks to them all, particular to the Memory of the late most skilful and most celebrated Doctor Ratcliff for the Instructions and Experience I have learnt from him and them, in the many Tears I have had the Honour to practice amongst them. The third Reason for my not printing. them

them, was, that I look'd upon it, as too much Presumption to instance my own Cures and impose them for Authority, without one or both of the abovemention'd Evidences; but as I constantly keep exact Journals of all Cases that fall. under my Care; of the Remedies I prescribe in them; and of the daily Alterations that happen to my Patients upon taking such Remedies; I can with little or no trouble digest them against a third Edition, tho' I had not leisure to do it in this; and may in that time have Opportunities to obtain the Revisal of them by what other Physicians were concern'd with me in any of those Cures.

It would be superstuous to make any Apologies now for my appearing in Print, this not being the first time. For writing on Philosophical Subjects in my Mother Tongue, I have Precedents from the famous Sir Isaac Newton and Mr. Lock, and if I could Instance no more, the Footsteps of the two most learned Men, that ever Great Britain educated, are what no one can blame me for treading in. The Receips are in Latin, because it would prove inconvenient to put

edg'd Tools into unskilful Hands. If this Work proves ever so little beneficial to Mankind, I shall thereby reap sufficient Fruits of my Labour, which shall always be employ'd, as to my Profession, in assisting every Body without Distinction to the utmost of my Skill and Power.

London, Dec. 24. 1714.

## TREATISE

OF THE

## CHOLICK.

#### CHAP. I.

Of the Symptoms, Accidents, and CAUSES of the CHOLICK.

HE CHOLICK is a Distemper, that affects all Ages and Sexes; 'tis so frequent, that there is scarce any Perfon living who has not felt it; and the Meaning of the

word CHOLICK is it felf as intelligible to every body, as the best Explanation any Author has, or can give of it. But not tion. to be deficient to usual Methods, the CHOLICK is properly described to be a violent

violent Pain in the Lower-Belly; for I cannot restrain it to the Colon, as most Authors do, tho' Galen himself found fault with the Antients for it (a), nor even to all the Guts, because (as I shall shew in the Sequel of this Treatise) its Seat is frequently in other Parts of the Lower-Belly, and that Description cannot be Adæquate, that does not include the whole. word Cholick is generally thought to take its Derivation from Colon, the Name of one of the Guts, in which Gut alone the Ancients, and many of the Moderns, erroneously suppose this Distemper is always Seated; tho' Julius Pollux derives it from Koλάζεθοι to Torture, and is of Opinion that the Greeks therefore gave that Gut the Name of Kahov, because 'tis subject to most Torturing Pains.

Its proper Symptoms.

A Person seiz'd with the Cholick, is afflicted with a violent Pain in his Belly, which is sometimes extended to its whole Circumference; now fix'd to a Point, and hores like an Augre; at other times removes from place to place. One suffers such violent inward Contractions, that it seels to him, as if his Guts or Bowels were surrounded and pull'd together with Cords;

W

bon

itle

<sup>(</sup>a) Satis mirari non possum quo pacto vehementissimos Cho quosque dolores, quacunque in parte consistant, ab omnibul eps Colo tribuantur. Galen, lib. 6. de loc. affect. cap. 2.

in others, not only the Guts, but even the outward Muscles and Skins of the Lower-Belly will be swell'd and stretch'd to such a degree that they seem ready to burst. The Belly is generally hard bound, and but a small quantity of Urine evacuated. These are the common, distinguishing and proper Symptoms of the Cholick; besides which, there is frequently a Sharp and Burning Heat in the Lower-Belly.

f

e

-

S

n

n

jt

St

is

ly,

nd

ch

There are several other Symptoms ac-Its accidencidental to this Distemper; as, a Fever; tal Symp-

Thirst; sharp, sower, or bitter Taste; Rest-toms. lessness, and want of Sleep; Vomiting, Belching; a Heat; Sharpness or entire Suppression of the Urine; the Jaundice; loss of Appetite. A beating in the Belly like a strong Pulse; a Cold Sensation or Chilness in it; Cold Sweats; Fainting Fits; Giddiness; Convulsions. Sometimes the whole Belly will be drawn inwards so close to the Backbone, that there is scarce any Appearance of it left: In one, the Navel only, with a small Circumference adjoyning to it, shall be drawn inwards; in others the Navel swell'd outels wards. Some void great Quantities of Tellow or Greenish Matters by Stool, withds put finding any Ease and Relief thereby:

The Excrements of others are like Cow Dung, full of Wind, and so light as to Iwim upon the surface of the Urine. The

Jimos Cholick frequently ends in a Palsey, or Epinibul epfy, sometimes in the Gout, Dropsy, Rheu-

B 2 matism, matism, or Extenuation of the whole Body.

Different Sensations of its Pain.

It is to be remark'd, that the Pain felt in the Cholick, is often of a different Senfation, not only in divers, but also in the same Person at different Times; as now a Burning, then a Gnawing Pain; sometimes a Beating, at other times a Pressing, or Heavy Pain; to some it seems as if their Bowels were torn, twisted, stretch'd, or contracted together; to others, that something like a Cold Iron is run through their Guts; and frequently a settl d Chilness, or intense Coldaffects all, or some one particular part of the Belly. These different Modifications of Pain, ought to be enquir'd after, because, join'd to other Symptoms, they give a Light into the true Cause of the Distemper: For though People commonly imagine, that all Cholicks proceed from one and the same Cause (and therefore generally take the same Remedies for them all) they arise from various ones, several of which require different Methods and some quite opposite Remedies for their Wherefore Physicians ought always to Examine very carefully, from what particular Cause each Distinct Fit of the Cholick proceeds; the Knowledge of which will not only prove advantageou to the Patients, as a means to their more certain and speedy Cure; but nothing wil give them that Opinion of a Physician

Cholicks
arise from
sundryCauses.

and make them have so great a Considence in him, as their Experience of his constant hitting the real Distemper, and its true Cause; in which, as Hippocrates (a) judiciously observed, the greatest part of the Cure consists.

To establish the Causes of the Cholick An Analy Analytically, I must examine all that Part tieal Enquiof Human Body in which this Disease is ry into the seated, and see what is contain'd therein Causes of capable, what uncapable, of producing it. the Chelick. The Seat of the Cholick is in the Lower-Belly; in which, I find by its Dissection, outwardly expos'd to View the Cuticle or Scarf-Skin; under that a reticulous Continuation of little Bladders, fill'd with a Humour call'd Corpus Mucosum; next to it the Skin properly so call'd, which is the Organ of the Sense of Feeling, abounds with an Infinity of little Eminences, nam'd Milliary Glands, thro' which the Insensible Perspiration, and the Sweat, are filtrated; and with innumerable Protuberances of a little larger Size, term'd Papilla Pyramidales, implanted with bulbous Roots, like small Onions, out of which the Hairs sprout in Men and Beasts, and the Feathers in Birds. Immediately under this Skin is spread a Continuation of little Bladders like to a Honey-comb, fill'd with an B 3 Oily

<sup>(</sup>a) Hippocrates, Lib. de Arte.

Oily Substance we call Fat; and under it, in some Parts of the Body, as in the Forehead, Throat, and Scrotum, is another Membrane call'd Panniculus Carnosus; but there is none of it upon the Belly, though many Anatomists pretend it is spread all over the Body. Next to the Fat lies the Common Membrane of the Muscles, under it five pair of Muscles, beneath those the Peritoneum, which is a thin smooth Membrane that covers all the Bowels of the Lower-Belly; under that a Ligament call'd the Navel-String, and a Membrane nam'd the Omentum or Caul, compos'd of two thin Skins, divided into a multitude of little Mashes, like to a fine Net, in which a great Quantity of that Oily Substance call'd Fat is contain'd; this Membrane is spread over all the Guts, fasten'd above and on both Sides, but floats loofe at the bottom: Under it are plac'd the Guts, which fill the greatest part of the Cavity of the Lower-Belly, in whose upper and middle Part, the Ventriculus or Stomach is seated; with the Liver high up on its right Side, and the Spleen lower down on the left; underneach the Stomach there is situated a Gland about fix Inches long, call'd the Pancreas, which adheres to the Duodenum, and lies upon the Back-Bone. The Guts being pul'd out, there appears a Membrane in the middle of them, call'd the Mesentery, which

is

is adherent to the Guts throughout their whole Length, and being of a circular Form, gathers them into a narrow Compass, and secures them from Twisting and Entangling with one another: Towards the middle of the Mesentery is a Gland call'd Pancreas Aselli, to which one sort of Lasteal Vessels ranging between the two Skins of the Mesentery carry the Chyle from the Gurs, and another fort of them call'd Secondary Lasteals convey it thence to the Chyle-Bag: Next appear the two Kidneys, one on each Side, with each their Ureter, and each a lesser Gland adjoyning to it, call'd Capsula Atrabilaria, or the Renal Glands: Then are seen the Great Vein, and the Great Artery, lying along upon the Back-bone; and under them are several Muscles; behind which is the Back-bone, perforated in its Length, and fill'd with the Spinal Marrow. There are other Muscles outward of the Back-bone, with the Common Membrane of the Muscles; the Membrane of Fat, the Skin, the Corpus Mucosum, and Scarf-Skin, all in the same Situation as describ'd in the Fore-part of the Belly; towards the bottom of the Belly in Man, are the Bladder, the Spermatick Vessels, the Vesicula Seminales, the Vasa Deferentia, and the Prostate; and in Woman, the Bladder, the Womb, the Ovaria, and all the Parts inserving to Genera-Besides all these, there is in the Lower-B 4

is

Lower-Belly a multitude of Fibres, Nerves, Veins, Arteries, and Lymphatick Vessels.

The outlick.

Now the Skins, Muscles, and all the ward Parts Parts mentioned to lye outward of the Peof the Belly ritonaum before, and of the Back-bone beof the Cho. hind, can none of them be the Seat of th Cholick, because a Pain in them is not (ase we find by the daily Experience of Inflammations and Boils in them) referr'd to the inward Parts, but easily distinguish'd to

> Ive outward, and to be of a different Senfation from the Pain of the Cholick.

> The Caul being a Membrane fill'd with a Fat Oily Substance, whose Use, in part, is to hinder the Acrimonious Salts of the Blood and Humours from fretting and corroding the other Parts of the Body, is by consequence scarce ever liable itself to the Action and Impression of any sharp corrofive Humour, or to the Sense of Pain, especially of so violent a one as the Cho-For as Galen (a) observes, that lick. Pain which is not violent, is not to be call'd the Cholick. And Experience convinces us, that any part of the Caul may be gangreen'd and cut off, with little or no Pain to the Patient: For which Reafons I am induc'd to believe, that the Caul is never the Seat of the Cholick, unless when being Schirrous or Swell'd to an extraor-

bu

br

KC

(6)

Nor the Caul.

(a) Galenus, lib. 6. de loc. affect. cap. 2.

raordinary Bulk, it presses upon the Guts, o as to stop the Passage of the Excrements. Nor are the Reasons given by Dolaus (a) of sufficient Weight to make me alter my Opinion. For tho' in an Omental Rupture the Caul may be inflam'd, and affected with violent Pains, they are then occasion'd by the Rupture (an establish'd Cause of the Cholick) which stretches the Fibres of the Caul to a preternatural Extention, which can never happen in its natural Situation. And the Instance of a Soldier, whose Caul was cut off, and he thereby Subject to violent Pains of the Cholick, which Galen cur'd, by making him wear Flannel Cloth upon his Belly, is of no Force, for it only confirms the Observations of many Anatomists, that those Persons are subject to Cholicks, in whom the Caul does not cover all the Guts. nit many Observations of Authors, who y Dissections have found the Caul Ulceated and Gangren'd, in Persons not trouled with the Cholick, I shall mention ut this one out of Blasius: (b) He having pen'd the Corps of a Young Man, who or many Weeks before his Death was afcted with continual Vomitings, and an xcessive Pain about the Pit of his Stomach.

de

(b) Blasius Observ. Anatom. 124.

t

e

s

.

<sup>(</sup>a) Johannes Dolans Encyclopedia, lib. 3. cap. 7.

mach, found the Caul black, and almost Gangren'd, through its whole Extent, and the bottom of the Stomach flam'd in that Part, where the Caul adher'd to it, and the violent Pain was felt. Whence I remark, that tho' the Caul, which reaches over almost all the Lower. Belly, was so much vitiated, yet the Pain was felt no where, but in the bottom of the Stomach, consequently not in the Caul, tho' affected in a far greater Degree than the Stomach, to a small Part of which only the Infection had spread it self.

The Kidneys and Ureters are the Seats neys, Ureter of the Nephretick Cholick, and the Bladder and Bladthat of violent Pains occasion'd by the der, none of them its Stone; but as those are distinct Distem-Seat.

pers from the Cholick I here treat of, none of them can be allow'd for the Seat or Cause thereof, tho' they frequently Impole upon Patients and Physicians for, and

are very difficult to be distinguish d from, be

the Cholick here in Question.

Nor the Proftate. Vasa Deferentia, or Seminal Veffels.

The Prostate, the Vasa Deferentia, the messpermatick and Seminal Vessels, are often the swell'd, inflam'd or ulcerated in Veneria fen Distempers, and thereby affected with violent Pains, which however are of forevery different a Sensation from the Cholick that no one ever mistook them for it consequently there is no reason to allow of any of them for its real Seat.

llow

Tho' it is possible, that the Vertebra of the Back-bone may by an ill Conformation, by a Dislocation, or Excressence, press upon the inward Parts of the Lower-Belly, so as to occasion a violent Pain in them, or may from a Caries (a) supply Acrimonious Nor the Particles to Corrode the Parts; yet as the Back-bone two latter Accidents are seldom met with, or Spinal and scarce possible to be discover'd 'till af- Marrow. ter Death, and the two former were never known to occasion this sort of Pain, it is not reasonable to reckon the Back Bone amongst the Causes or Seats of the Cholick, ats and much less the Spinal Marrow contain'd within its Cavity, because it is of the selfthe same Nature and Composition with all
the other Nerves, which, as I shall enone deavour to prove, are incapable of producing the Cholick.

Piso indeed, and the Learned Willis, will Notion of a and have the Cholick to be a Nervous Distem- Nervous om, per, and the latter seats it chiefly in the Cholick. Mesentery. He pretends that some Recrethe ments of Humours are carried down by the Nerves from the Brain, into the Meterial Centerick and other Nervous Plexus's of with the Lower-Belly, where they are stopp'd, because being of a thick viscous Nature, they cannot enter into the Lymphadusts, it nor be discharged through the small Rallow

mifications

Tho (a) Bonetus Anat. pract. p. 521. p. 1175.

mifications of the Vessels into the cavity of the Guts, but gathering in those Plexus's of the Nerves stagnate, swell, and cause a Distention or Irritation in them, either by their Quantity, or by a Fermentation produc'd in them, by a mixture of some fix'd Salt Humours from the Blood; and that this Distention or Irritation affects a multitude of Fibres with which the Mesentery abounds, and causes Contractions and Painful Vellications in them, from whence the Cholick arises; and that various Nervous Fibres proceeding from these Plexus's in the Mesentery, being distributed into the Guts, and almost every Part of the Lower-Belly, cause in them also Contractions and Painful Vellications. (a) This ingenious Hypothesis seems very plausible at the first View, and the great Reputation of its Inventor has not only left it uncontested by any to this Day, but has also establish'd it amongst all Authors and Phyficians as undeniable, and even the Principal and most common Cause of the But fince I cannot allow of what this Learned Doctor advances, I hope the Reasons I shall offer to the contrary will excuse my Disagreement with him wherein I shall endeavour to make it appear, 1st, That his Hypothesis is not well grounded En

This Hypothesis of Willis is ill-groun- Willis's ded; because establish'd upon Suppositions Hypothesis without any Proofs. The Recrements he refuted. supposes to be convey'd by the Nerves from the Brain, into the Plexus's of the Mesentery, must be the Animal Spirits, because the Nerves contain nothing else. If these Animal Spirits or Recrements can continue their Motion down the minute Channels of the little Nerves, into these Plexus's, Why should they stop there? Nothing but an Obstruction can occasion it, and it is notorious, that an Obstruction of a Nerve will occasion a Cessation or Diminution of Feeling in the Part, which is quite the Opposite to an Irritation or Pain in it. Or should it be admitted, that the Spirits may be stopt in a Nerve by other Causes than an Obstruction, there is no Reason why this should happen oftner in the Mesenterick Plexus's than elsewhere. For his Supposition of the Nerves inosculating with one another, and forming a new ded Emporium, Basin, or Receptacle for the Spirits,

in these and other Plexus's, is but imagina-

ry, and so far from Truth, that every lit-

tle

tle Nerve continues its Course from the Brain down to the Part it belongs to, in a distinct separate Thread (not only thro' these Plexus's, which, put into Water, may be disentangled into Fibres visibly separate and distinct) but also thro' the Spinal Marrow, wherethey are so confus'd, they seem all together to make but one great Nerve. But admitting, as I said, that the Spirits should stop in these Plexus's, yet it would in not from thence follow, that they must ferment and cause a Swelling; nor that a 'r Fermentation or Swelling, if there were and ny, would occasion so violent a Pain as be the Cholick: Neither doth he alledge a- do ny Reasons, that I find, to prove this As- Es fertion; nor have I ever met with any Exder it probable, but rather such as prove in the contrary. For if you tye a Ligature har upon the largest Nerves, and repeat the A Experiment ever so often, you shall never wh perceive the least Swelling above the Ligature. And if he imagines that the Swel- cafe ling and Distention of the Nerves, tho' No imperceptible, may cause a Pain within a them, and will have the Seat of Pain to vit lye (as he seems to think it does) within me the Substance of the Nerves, in the Part and it self; 'tis what neither he, nor any body else hath yet made appear by any probable Arguments; and if they had, would be easily resuted by this one Matter of Fact, that villi 10

a 0'

r,

2-

al

m

e.

ts

dy

ole

be

that whenever there is an Obstruction in my Nerve, there is no Swelling, neither loes any Pain follow from thence, but on the contrary a Cessation or Diminution of the Sense of Feeling in the Part; as it is manifest and undeniable in the Palsie. But. lays he, perchance some fix'd Salt Humours separated from the Blood, may mix with the Spirits in the Mesenterick Plexus's, ld and cause an Effervescence in them, whence ift violent Pain, or the Cholick will arise. a 'Tis but perchance, without the least Proof; a and I would willingly have any of his Aas bettors answer me, why the same Cause a does not as frequently produce the same If Effects in the Plexus Cardiacus, or Pneu-x-monicus? But admitting the Mixture of n-these fix'd Salt Humours with the Spirits ve in the Mesenterick Plexus's, and that it shall re happen no where else, what would follow? he A Fermentation: The Consequence of er which he pretends would be a Convulsion is in that Part. And will a Convulsion ocel-casion so violent a Pain as the Cholick is?
No: Willis himself owns the contrary
in a nother Place (a). And I have met to with three Persons in my own Practice, in one at Raib, another at Marseilles in France, art and the third now living in Shrewsbury, who

<sup>(</sup>a) Licet dolor motus convulsivos, attamen hi istum per Et, saltem magnum & diu perseverantem minime producunt. 1at Villis de Anima Brutor. Part. 2da. cap. 15.

who were and had been for several Years in continual Convulsions of all the external Parts of their Bodies, like to the Chorea Sancti Viti: I examin'd them with particular Care, and they all three assured me, they selt no great Pain, nor were any of them more subject to the Cholick than before, tho' 'tis probable, that all the inward Muscles (amongst which the Guts are to be reckon'd) were seiz'd with the same constant Convulsions as those of the outward Parts.

A Pleasure peculiar to all Inventors, made the most ingenious Willis not only less as curate here, but even deficient in his usual Force of Reasoning, in Anatomy, and in the proper Use of the Parts of Human Body; things in which he generally excell'd and for which he is so deservedly renown throughout the whole learned World go One Reason he gives, why the Spirits of as Recrements stop in the Mesenterick Plex be us's, is, because they are so thick and vil sp cid, they cannot be receiv'd into the Lympheducts. But can any Physician of Cl Philosopher suppose a Humour, thin an pe active enough to be convey'd from the Head down to the Mesentery, thro' theve smallest invisible Channels imaginable; an on yet too thick and viscid to be receiv'd intece other Channels, considerably larger (an ve such are the Lymphaduets?) Or will angre Anatomists allow, that the Use of th Lyn

e 0

add

th

Lyn

Lymphaducts in the Mesentery (appropriated to carry the Lymph into the Pancreas Afelli, there to be mixt with the Chyle) is to receive and carry off the Spirits from the Nerves? Or that the Nerves themselves throw off the Spirits like an Excrement into the Guts. Or lastly, that these Animal Spirits or Recrements which he supposes to be so thick and viscous, that they could not pass thro' the Mesenterick Plexus's (Basons, in his Opinion, capable of containing a large Quantity of Spirits lodg'd there, to be distributed on occasion act into many Nerves) shall yet afterwards run usu thro' a vast number of much smaller Vessels. and than they first came down thro' from the Head, and occasion violent Distempers and Irritations in them, when they had no wn't fuch Effect in their Passage thro' those larorld ger Nerves; for if they had, then a Pain as great as that of the Cholick would have plex been felt, from the Head, all along the vi Spinal Marrow.

the Having given these Reasons why the The Mesenn o Cholick cannot be produc'd after the man-tery not the an per Willis pretends; I am next to prove, Seat of the that it is improbable the Mejentery should thever be the Seat of the Cholick. My Rea-; an ons are these; ist, Because I my self have dintecen present at four Dissections, wherein (an we found the Mesentery Ulcerated or Gan-langren'd in Persons who had not been subject

to the Cholick when Living; and Anatomists recount a multitude of the like In-2dly, Because the Mesenteries of most Dropsical People are found corrupted; yet the Cholick is no usual Symptom or Companion of the Dropfy. 3dly, Because Schirrous Tumours, Impo-Swellings, stumes, Ulcers, and Stony Concretions in the Mesentery and Meseraick Veins, often occasion Consumptions, by stopping the free Course of the Chyle into the Blood, without any Symptoms of the Cholick, as many Authors attest from Observations. and Ocular Proofs in Dissections. (a) Bontius assures us, there is a Distemper very frequent in India, proceeding from Defects in the Mesentery (which in this Disease is always found Impostumated or Ulcer'd, and often intirely confum'd) by which the Pati-

Patients waste to Death, without the least Sense of Pain (b).

That the Notion of a Nervous Cholick is The Notion groundless, I shall endeavour to make out, of a Nerchiefly by refuting the Arguments and rous Cholick refuted. Reasons it is grounded upon; and also by Mechanical, and, in my Opinion, more rational Explanations of the same Symptoms from other Causes; which latter part shall be only briefly touch'd in this Chapter, but more fully provid in the Sequel of this Treatise.

. 614

The Nervous Cholick is, by the learnedst Assertors of that Opinion, said to be produc'd after the following Manner. They suppose that the Spirits flow with Impetuofity into the Nerves of the Lower-Belly, whereby they either swell and distend the Channels of those Nerves, or else mixing with other Humours occasion a Fermentation; by either of which Causes they pretend, that the sensible Fibres of the Parts in which this happens, will be vellicated and drawn into Contractions and Convulsions, whereby a Solution of Continuity, or Disruption of the Fibres, and consequently a violent Pain, or the Cho-

<sup>(</sup>b) Bontius Observat. xi.

Cholick will be occasion'd (a). I have already shewn, pag. 13. that there are no sufficient Grounds to suppose the Spirits should stop more in the Plexus's of the Lower-Belly, than elsewhere, but rather the contrary, according to their Systems. 2dly, pag. 13. That if they should stop there, they would then occasion a Cessation or Diminution of Feeling in the Part, not a Pain in it. 3dly, pag. 14. That suppose they should cause Contractions and Convulsions in those Fibres, those Convulsions would not occasion Pain.

To strengthen which Reasons, I will add but two, out of many I could instance. The 1st, That in Epilepsies, several Parts of the Body, and consequently the Nerves in those Parts, suffer strong Convulsions; and yet the Patients are so far from suffering

ring,

Spasmodicam dicemus Colicam. eam, in qua spiritus Annimales, à materia aliqua subtili sta afficientur, et, motum ordinarium intermittant, & ad Mesenterium aliasque partes sensiles membranaceas tumultuose influant, ibidemque vellicando sibras Nervorum, easdemque ladendo ac rumpendo de lorem non exiguum producant. DOLÆUS Encycloped lib. 3. cap. 7.

<sup>(</sup>a) In Colico dolore materies fibras sensiles distrahens, En ab invicem divellens, proindeque in corrugationes dolorificas irritans, haud usque in Cerebro commorari, verum exinde per ductos Nerveos versus Intestina descendens, alicubi in eorum vicinia juxta partes dolentes congeri, & subinde velob plenitudinem sponte turgescens, vel cum alio humore Effervescens morbi hujus Paroxismos inferre videtur. Tho. Willis, de Anim. Brutor. Part. 2. cap. 15.

ing violent Pains, that there is frequently an entire Abolition of the Sense of Feeling, and always a great Diminution of it, in so much that one may often pull, pinch, cut, or burn them, without their perceiving it. The 2d, That when the Cause is translated from the Fibrous Parts upon the Nerves, as it happens when the Cholick ends in a Palsy, then all Sensation of Pain ceases, tho' the Cause affects the Nerves more at that time, than it did before. And yet this is the very Reason Willis (a) assigns, to prove that the Seat of this Pain is in the Nerves themselves.

One Reason they give for establishing the Seat of the Cholick in the Nerves, is, because they can suppose nothing besides the Spirits active enough to transfer the Pain in an instant from one place to another; and because it is hard to conceive how any Humour in the Guts can so affect the Loins, as to cause a Pain in them, which is a Symptom very frequent in the Cholick. To which I Answer, that for

(a) Dolores Colici ingravescentes non raro in Paralysim terminantur, quod certe indicio manifesto est materiam morbissicam non per Arterias, sed Nervos deferri, ejusque sub-

jectum sive sedem non Intestinorum Cavitates aut Tunicas sed Mesenterii plexus Nerveos esse. Willis de Anim. Bru-

want of a thorough Examination, they mistake the Esset for the Cause or the Second, Subservient or Instrumental Cause, for the Prime and Efficient one. Nerves, or rather the Spirits contain'd in them, are undeniably the Instruments by which Pains are transferr'd in an instant from one place to another, and by which the Effects of the Prime actuating Cause are perceiv'd; but are never the Efficient Causes themselves of any Pains, which are always occasion'd by something Externa or Adventitious to the Body; which tho' it may not be always scated in, nor even adjoyning to all those Parts that are affected with Pain, yet does vellicate and irritate the Nerves belonging to those distant Parts, as they happen to run through, or to have Communication with the Part in which the Principal Cause resides. So we find by daily Experience, that a Pain is felt in a Part amputated, and referr'd (for Instance) to a Finger long since cut off; which is occasion'd by an Irritation of the particular Nerve belonging to that Finger, made in a superior Part of the Hand or Which, to omit many others, is a sufficient Proof, that all Sensations are made in the Brain, and not in the Part. Another Argument they bring for this Assertion, is, that the Spirits often produce the like Disorders in Children when they Breed their

0

I

b

a

fa

C

S

21

their Teeth bard. But this is begging the Question; they allege no satisfactory Reafons to convince us that the Spirits occasion these Disorders in Children, but only Explicate it so themselves, because they know not how to account for it otherways, and would have their own Suppositions allow'd for Proofs in other Cases; whereas the true Cause of these frequent Convulsions in Children, is the Acidity and Sowerness the Milk Contracts in the Stomach and Guts; whereby as it passes through the Lacteals, into the Mesentery, it irritates the Nerval Plexus's, and by those Irritations causes greater and more violent Influx's of the Spirits into all those Parts, whither the Plexus's send Ramifications of Nerves; where mixing with the Sulphureous Particles of the Copula Explosiva (which also partake of the same Sowerness, that the Chyle and the Blood has acquir'd) they cause violent Contractions and Convulsions. But the Pain then felt, does not, as Willis owns, arise from those Convulsions; but, as I said before, from a violent Reflux and Undulation of the Spirits back to the Brain, made by the same Cause, at the same time. And for a Proof that these Convulsions are caus'd in Children by the Sowerness of the Milk, I need only alledge, that they are cured by Corral, Crabb's Eyes, and such like Remedies, which correct C 4

ir

that Sowerness. But for a farther Confirmation, and to shew the like in other Cases, Does it not often happen to many People an Hour or two after Meals, that they feel a Chilness or little Shivering throughout their Bodies? which proceeds from the Coldness of the Chyle irritating the Nerval Plexus's, as it passes through the Mesentery. And in Agues, a greater Shivering or Shaking is diffus d through all the Parts, which is known to arise from Sower Acid Indigestions, collected in the Cavities of the Guts, and carried at that time by the Lasteals, through the Mesentery into the Blood. This is arguing after Matter of Fact, the other upon Suppositions without Grounds; and if I can, as I hope to do in the sequel of this Treatise, explain every Symptom this way, at least as Mechanically as they do it otherways, I doubt not but it will be allow'd to be the better way of Reasoning upon Things unseen, and to carry a likelier Face of Truth.

I say then, 1st, That all Sensations and all Pains (that of the Cholick amongst the rest) are occasion'd by an Irritation of the Nerves, in or belonging to that Part where the Pain is felt; and that this Irritation, according to the degree and manner of its Action, causes a more or less violent Restur,

Reflux, or Undulation of the Spirits from the Part affected, back to the Brain; in which (the Brain) the Impression is made, and the Pain felt, though referr'd to the Part. 2dly, That no Impulse, Pressure, or Motion of the Spirits down from the Brain into any Part, can ever cause a Sensation My Reason (to omit many or Pain. others too long to be inserted here, but which I may hereafter publish in another Treatise against the common receiv'd Notion of such a multitude of Nervous Distempers) is, because 'tis an undeniable Truth, that I can cause a troublesome Senfation or Pain at any time, and in any Part of the Body, by only striking or imparting a violent Motion to that Part: This Motion, according to all learn'd Physicians, must be carried by the Nerves up to the Brain, to produce the Sense of Pain (for how otherwise canthere be a Remembrance of it, without a new Action or Stroke?) Therefore I certainly know, that a violent Motion of the Spirits from any Part up to the Brain, will occasion the Sense of Pain; and if I can account for all Pains whatfoever from this Cause, which is undeniable, why should I seek for other Causes ess evident and satisfactory? Moreover, I never read, nor could yet imagine to my elf, any one Instance or Proof whereby the

the Motion of the Spirits down from the Brain into a Part, appear'd to occasion a Pain in it, but many to the contrary; as that in the continual Beating of the Heart (and the same may be said of the Pia mater, and Guts) to which the Spirits must constantly flow from the Brain, for its muscular Motion, not the least Pain, no not so much as a Perception of its Beating is felt, unless when it hits against the Ribs or some other Part, and then the Perception is occasion'd by a Reflux, or Undulation of the Spirits from that Part it strikes against up to the Brain: And that in Running, violent Exercises, and Convulsions, ( there is no Pain felt in the Muscles, tho' w tis certain that the Spirits then flow down from the Brain into them in great quantities. I own that the Spirits which flow w down from the Brain into the Muscles, in are the Principal, though not the sole tu Cause of Contractions and Convulsions, but from neither of them arises any Pain; or if ever there does, 'tis only then when they are so violent as to occasion a Reflux, or contrary Undulation of the Spirits from the Part back to the Brain.

I come now to the true Seats of the Cho. Cholick is lick; and first to the Peritonaum, wherein Seated inthe I affirm the Cholick may be, and is often Peritonaum. Seated, tho' Willis denies it for the follow-

ing Reasons (a): Because it is a thin Membrane, has but few and slender Vessels, is uncapable of containing any large quantity of Humours, and unable to contract or press down the Bowels: To which I answer, that the Periosteum is a much thinner Membrane, yet subject to most cruel Pains; and that the Peritonaum is both capable of containing, and often found full of Humours, as several Authors (b) testifie from ocular Proofs. Heers (c) relates of one who died by Cholical Pains, violent round his Nayel, that his Peritonaum contain'd above twelve Pound of putrid Matter: Bylerus (d) assures us, that he open'd a Woman who died also of a Cholick fix'd about her Navel, and found the Periton aum corroded by a sharp bilious Humour, just in that Place, where her violent Pain lay. Scultetus (e) in the Dissection of a third, who was tortur'd with insufferable Pains about the Navel, found the Peritonaum swell'd to a prodigious

<sup>(</sup>a) Mineram vero Colicam à Peritoneo rejicimus, quia membrana bac cum admodum tenuis, ac vasis paucioribus nt tantum exilibus donata sit, nec magne humorum affluxionis capax, neque ipsa ut convellatur, viscera substrata comprimende, aut contrahendo in dolores urgere posse videtur. ald Vitreous Pituit (1). Salmuth relates a case wherein the whole Colon was so replete with Pituitous Matter, that there was only asmall Passage left, the size of a Finger, for the Excrements to pass thro' (k). Chomel instances another, where the like Pituitous Matter adhered in little Parcels or Knobs to the outward Coats of the Guts, and thereby occasion'd the Cholick (1). This Humour tho' term'd Melancholick, Pituitous, and Cold, by the Antients and ma-Moderns, (who imagine it to be a Phleg-d matick unactive Part discharg'd from the s, Blood) is in reality nothing else but a whitish viscous Recrement, separated conthe same Nature with the Ferment of the Stomach, but more viscous and glutinous) ts erving to the Concoction of the Aliments, und to defend the Guts from Irritations and corrosions. Now if by any morbid Dihe position of the Blood, from whence this af Recrement is separated by the Intestinal lands, it becomes not only more viscid terned glutinous, but is also loaded with sharp of corrosive Salts, 'tis manifest it may old oth adhere to the Guts by its Glutinoy, and occasion Pains in them by the Pungency

form'd

lection of Examples, where Toph's and Stones had been voided by Stools. Now whether the Stones found in the Guts are generated within their Cavity, or fall from the Liver or Gall-Bladder into them, is no great matter; fince 'tis undeniable that they are often found in the Guts, and may either by their Weight, by their sharp Points, or by stopping the Excrements, occasion violent Pains in them. Though to me it seems probable that Stones are often form'd within the Guts themselves; my Reasons are, 1st, Because if they came from the Gall-Bladder, or any other Part of the Liver, they would, being but small, probably be voided with the Excrements, before they had time to grow much larger: 2dly, Because they could never be perforated (as it happen'd in the above-cited Instance from Ballonius) after their Formation; 3dly, Because Zacutus found a Stone as big as a Chestnut, firmly and almost inseparably adhering to one fide of the Colon (c) where in all appearance it must have be the gun its Lapidification: 4thly, Because Stones are often found in the Stomach, whither they cannot fall from the Liver, or any other Part; and if they grow in the Stomach,

th

Se

<sup>(</sup>c) Zacutus Lusitanus prax. admirand. lib. 3. cap. exxxiii.

mach, why not in the Guts? 5thly, Because Horstius assures us, that he found several little round Balls affix'd to the Colon, barden'd but not quite Stony, yet of that Concretion, that they would certainly in process of time have become Stones (d).

<sup>(0)</sup> Gesnerus Historia Animalium, lib. 2. cap. de Lacertis.

Bartholinus, and Wolgnad (p) affure us, that one Catherine Geileria, who died Anno 1662, in the Hospital of Altenburg, did for Twenty Years together vomit up many Toads, and a great deal of stuff like to their Spawn, which occasion'd violent Pains of the Cholick in her Stomach. These indeed are wonderful Causes of the Cholick, and mention'd here, not as such which I suppose will ever occur again, or ought to be enquired after; but to imprint, by the Extraordinariness of the Facts, in the Memory of Practitioners, that a Cause seldom thought of, viz. Worms and Insects within Human Bodles, are very often the Original Causes of Cholicks, Convulsions and Epilepsies, (q) not only in Children, but in Adult Persons. But if any one is pleas'd to dispute the Truth of these strange Facts, I can say no more than that they are attested by Authors of good Repute, whose Books and Pages I have cited, and may be turn'd to. Yet to me they feem both possible, and no ways inconsistent with the usual Course of Nature.

### CHAP. II.

Mechanical Explanations of the several Symptoms and Accidents of the CHOLICK.

In this I shall endeavour to account for their Effects, and to explain how, and by what Mechanisms, they are capable of occasioning such exquisite Pains. To do this clearly, it will be necessary to premise, and settle an Idea of Pain in general.

Pain is by all Authors describ'd to be; a troublesome Sensation, proceeding from a Solution of Continuity in the Part; wherein if I differ from them, 'tis not out of any Affectation of Novelty, or to appear singular, but from a sincere Desire to discover and deliver the Truth in every thing, as far as it is known to me, without suffering the Authority of others to prevail over my Reason. Wherefore I describe Pain to be A trouble some Sensation, occasioned

The De-Pain.

on'd by a violent Reflux or Undulation of the scription of Spirits, from the Part affected up to the Willis (a), and all Authors una-Brain. nimously agree, that there must be a violent Motion in the Spirits, to occasion the Sense of Pain: I have prov'd (pag. 26.) that all Sensations whatsoever are made in the Brain, and only referr'd to the Part; therefore it evidently follows that this violent Motion must be communicated up to the Brain, before it can occasion the Sense of Pain referr'd to the Part: consequently in the Perception of Pain, every thing does of necessity always happen that is mention'd in this Description of it; viz. a violent Motion of the Spirits, and a Conti-The Soluti-nuation of that Motion from the Part up to

muity not ne-Sense of Pain.

on of Conti-the Brain. But it is not so of the common cessary to the receiv'd Description of Pain, for a Soluti on of Continuity, tho' it may often hap pen, is not inseparable, and always neces fary to the Sense of Pain; which I prove by the following Matters of Fact. That a Feather drawn gently over one Lip, will occasion a troublesome Uneas ness or Pain, without any Solution Continuity. 2 dly, If the Solution of Con tinuity were that which occasion'd Pain it would follow, that the greater the So

lution

<sup>(</sup>a) Willis de Medicamentor. Operat. Part. 2. Sect. Cap. 6.

lution, the greater would be the Pain; whereas Experience convinces us of the contrary: For if you cut a Tendon or Nerve, the Pain is moderate and soon ceases; if you prick or stretch them, shall be violent and of long Continuance. In an Impostume that suppurates, there is a much greater Solution of Continuity, but much less Pain, than when it began with an Inflammation. The Stone in a Kidney shall occasion violent Pains, whilst the Substance of the Kidney continues united, which entirely cease, when it is difsolv'd into Corruption. Opium causes the Cessation of Pain, but not the Reunion of a Solution in the Continuity of a Part; on the contrary, it obstructs the Cure of Wounds. And to use a familiar Comparison, there is the same Reason to say, that the Stretching of a String does not suffice, but that the Breaking of it is necessary to produce a Sound; as that the Irritation or Stretching of a Nerve, cannot create a Pain without the Solution or breaking of it. Again, the Solution of any Muscular, Tendinous, or Membranous Fibres, can contribute nothing to the Sense of Pain, because not they, but the Nerves are the Organs of the Sense of Feeling. And if you will have the Nerves to be once broke, they can be no longer capable of transmitting any Motion, (either by the Spirits con

he naiothe

be

6.) in rt; vi-

the nieery
that

viz.

n o Con Pain

e So

ect.

contain'd in them, or by their whole Substance) from the Part affected up to the Brain, wherein all Sensations are made; consequently there could be no such thing as a continual persevering Pain; but every distinct Sensation of Pain would terminate the same Moment it began, that is, with the Solution of the Continuity, or the breaking of the Nerve; which is contrary to daily Experience. From these Reasons I conclude, that the Solution of Continuity is no ways requisite, nor has any relation, to the Sense of Pain; but that all Pain is occasion'd by the Irritation or Pressure of the Nerves in the Part affected; whereby a violent Motion, Reflux, Undulation of the Spirits is made from that Part up to the Brain. Indeed Willis (a), tho' he affirms a Solution of Continuity to be always necessary to the Sense of Pain, yet allows that the continuous Parts, especially the Nervous Fibres, are not broke, but that it suffices (as I say it does) to have them irritated, press'd, or stretch'd: But he will have it, that the Spirits contain'd in the Nerves are thereby torn asunder from their mutual Cohæsion, and diffipated; in which Division and Diffipation of the Spirits, he seems to establish

<sup>(</sup>a) Willis de Medicamentor. Operat. Part. 2. Sect. 3. Cap. 6.

Stablish both the Solution of Continuity, and the Sense of Pain, residing and felt in the Part it self. But no Division of the Spirits, which are a Liquid Body, can be truly stil'da Solution of Continuity, which is only proper to solid Parts. And he must certainly be mistaken in his Notion of Pain, when he affirms that it confifts in the Disunion and Divulsion of the Animal Spirits, whereby the Nerves are stretch'd and contracted. (a) To which he pretends there is absolutely requisite either a Mixture of heterogeneous Particles in the Spirits themselves, or else the Action of some outward Cause penetrating thro the Pores of the Fibres. I say he must be mistaken herein, both as to the Effects and the Causes; because it is undeniable that I can at any time occasion a violent Pain in any Part of a Body ever so sound and well constituted, by the bare Pressure of my Finger; and no body can suppose heterogeneous or morbid Particles, to be mixt every where with the Spirits in the foundest and healthiest Constitution; nor that the Pressure of my Finger does convey any thing thro' the Pores into the Nerves; wherefore it remains that such a Pressure can occasion a Pain no otherways, than E 4

<sup>(</sup>a) Willis Pars Pathol. Cap. 1. de Cephalalgià.

than by forcing the Spirits to flow in a violent Motion from the Part affected up to the Brain; which being the Nature of all Liquids, is plain and easie to be conceiv'd, and must necessarily happen, if all Sensations are made in the Brain; as they certainly are, and not in the Part itself, as Willis (a) and others fallly imagine, when they pretend that all Pains are occasion'd by the Contractions and Convulsions of the Nerves within the Part affected. For what Proof can any one bring me, that there ever is a Contraction in the Nervous 1th Fibres alone? Or what Reason is there or fo much as to fancy it? fince Willis him-wifelf (b), the Assertor of it, and all Anato-Property mists, are convinc'd from the Experiment So of tying a Ligature upon the Arteries, Pa and from other Reasons, that the Spirits na contain'd within the Nerves, whether duly constituted, or vitiated by heterogeneous Mixtures, are not capable of making to the least Contraction in the Muscles, but to require the Concurrence and Mixture of is, some other Particles from the Blood to pa effect it; (which Mixture is made within led the Pores of the Muscular Fibres, not Car within the Cavities of the Nerves) how affective then shall the Nerves be contracted? or ler. why the

A Tensive
Pain, how
occasion'd

1. A Tensive Pain, which induces an Idea of a violent Stretching in the Part, occasion'd by a sudden and preternatural Distention of it. This Distention equally affects the Nerves of that Part, as its fleshy or muscular Fibres. The Nerves can't be stretch'd out into a longer Extent, but that the Diameter of their Cavities must be lessen'd in Length, nor their Cavities so lessen'd, but that part of the Spirits contain'd in them must flow into some or ther Place; not into the Part affected, for that being already fill'd to a preternatural Repletion, it presses every thing from it; consequently no other way is left for the Spirits to flow, but backwards up their own Channels, into the Corpus Callosum Cere.

erebri; which being a common Bason, or eceptacle for the Spirits, there is both oom for them in it, and thither their iolent Reflux or Undulation is useful and ecessary, to cause such a Pressure on the rigin of those Nerves, as shall both ake the Soul sensible that something reternatural affects that Part, and also of he manner of its affecting it; which is, nat a number of Fibres contain'd within e Circumference of such a Part, are all retcht with Violence at the same time. hence the Soul conceives the Idea of a ensive Pain, very distinguishable from that fa Pressive Pain, occasioning the Con- A Pressive eption of a heavy Load weighing upon Pain. e Part; which tho' it may at another me affect all the same individual Fibres nd Nerves in the self-same Place, eate a quite different Sensation, e different Undulation of the Spirits, occeeding from the different Action of e Causes, which in the Tensive stretch e Nerves of the Part, in the Pressive eigh upon them, or force them against me other Body that resists. These and other different Sensations of Pain, are ery difficult to be rightly distinguish'd ander, when seated in the inward Parts of eBody (of which we have no clear Ideas) ndit is only from Experience, and a Comparison

parison to what we have observ'd in the outward Parts, that they are in some manner known and diftinguish'd. For Ex. ample, that fince upon the violent swell ling of my Hand, I felt that Modification of Pain, I call Tensive, if the like Sense of Pain happens to any inward Part, I immediately imagine there is such ano ther swelling in that inward Part, as I faw in my Hand. The Sensation of Tensive Pain may be occasion'd in the Cholick, either by Winds which swell and stretch the Guts or Stomach; by the Rarefaction of Humours in any part of the Lower-belly; by the Retention and Hard. ness of the Excrements; by Ruptures, Inflammations, Obstructions, or Tumours; by a great Collection of wat'ry Humours with in any Cavity, or between any Skins; by Stony Concretions; or by the weight of an Inferior Part, pulling down a Superior on with Violence, as the Liver may the Dia phragm when adherent to it. The Pres five or Heavy Pain may happen in the Cholick, by the Relaxation or Rupture Ligaments, whereby the Liver, Spleen Womb, &c. may fall from their natura Situations, and press upon Inferior Parts or by Tumours, Schirrus's, Stones, &c pressing the adjacent Parts against an firm Substance.

the Patient as if an Augre were screw'd Pain. into the Part, is occasion'd by whatsoever Cause begins its violent Action upon the Surface, and penetrates by degrees deeper and deeper with the same Violence far into its Substance. This may happen in the Cholick, when the Gall, or any other corrosive Humour, is imbib'd and penetrates into the Coats and Substance of the Guts, Stomach, or other Parts within the Lower-belly.

3. A Pungent or Pricking Pain, is that A Pungen which represents to us the Idea of some Pain. Sharp pointed thing penetrating suddenly into the Part. This may happen in the Cholick, either from the Action of Sharp, Acid Humours, which do actually perforate the Nervous Fibres with their acute Points, like Needles; or by Erisipelatous Inflammations in the Guts, or other Parts of the Lower-belly, which when extended to a very narrow Circumference, occasion the like Sensations; as is daily experienc'd in the Erisipela of any outward Part, where, though the real Cause is visible to the Eye, we can't but fancy we feel the pricking of a Needle in the Part. This Sensation may also be occasion'd by the Suppuration of any Tumour within the Lower-belly, which discharg-

ing its corrupted Humours thro' a small

Orifice

## Explanation of the Symptoms

Orifice of the Skin, contracts all the Pain into that narrow Compass; and lastly, by the Sharp Points of Stones lodg'd in any Part of the Lower-belly.

ALauncing Pain.

4. A Launcing Pain, is that wherein it feems to the Patient, as if some sharp-edg'd Tool did cut thro' the Part suddenly and with Violence at repeated Intervals; or elfe that something Tears it by Starts and Jerks This Sensation may happen, either when the Pains of the Cholick proceed from Cancer in the Lower-belly, whose fix'd corrofive Salts being put into Motion irritate and vellicate the Nervous Fibres which run across its Substance; as by daily Experience we find it happens in the Cancers of the Breast, and of other outward Parts: Or else by the Suppuration of any inward Tumour, which fermenting, and emptying itself by Intervals, irritates the Nervous Fibres of the Skins it is discharg'd thro', by Starts and Terks, answerable to the Intervals of its Evacuation.

when Irritations of different Degrees, are Pain. made in distinct and separate Fibres of the same Part, at one and the same time; whereby it seems to the Patient as if many Teeth tore and ground it. This Sensation may arise in the Cholick when different Humours, as those of the Gout, Scurvy, Gall, and Rhumatism happen to corrode the same Part in distinct Fibres, and with unequal Force at the same time. But this, neither as to the Causes, nor as to the manner of Production, do I affert as a thing positive and certain, but only as a probable one.

7. A Beating Pain is that, wherein an A Beating uneasse throbbing Motion, returning by Pain. short Intervals, is felt in the Part. This may happen in the Cholick either by the Extraordinary Dilatation of the Great Artery, by the Rupture of a small one, or by an Obstruction that hinders the free Circulation of the Blood, thro' the sleshy

Fibres, from the Arteries into the Capillary Veins; whereby the Blood being stop't in the Part, and fresh Supplies

continually prest upon it from the Heart, it must inevitably swell and stretch the Fibres of that Part, at the same Inter-

vals that the Heart beats, and the Pulse

is

### Explanation of the Symptoms

is felt in the Arteries. This Beating Pain will be perceiv'd in the Lower-belly, when soever the Cholick is accompany'd with, or occasion'd by any of these three Causes; viz. the Dilatation or Rupture of an Artery, or an Obstruction; Instances of which may be seen in the undercited Authors (a).

A Tearing Pain. 8. A Tearing Pain, wherein it seems to the Patient as if the Fibres of the Part were torn from their adherence to each other, happens when the Salts concreted into large Particles, or any Humours press between, and force asunder the little Nervous Fibres, which were

closely united and adherent before.

Now whereas these Causes, acting with Violence, occasion a sudden and strong Undulation of the Spirits (the after different Modifications) from the Part effected up to the Brain, a Pressure, Divulsion, or Impression is thereby made in the Corpus Callosum Cerebri upon the Origin of the Nerves belonging to the Part affected, whereby the Soul, according to the hidden Laws of its Union with the Body, is made sensible both of the Pain, its different Modification, and of the Place or Part affected.

<sup>(</sup>a) Michael Doringius ad Sennertum Cent. 1. Epist. 25.
Bontius observat. viii. Columbus Anatom. lib. xv. Falle.
pius lib. de Tumor. praternatural. Cap. 14.

The chief Symptom of the Cholick, is a violent Pain in the Lower-belly; which may proceed from any one of the several Causes already mention'd, occasioning a sudden and violent Reslux or Undulation of the Spirits, from the Part affected up to the Brain.

When the Pain spreads itself all over the Belly, 'tis occasion'd for the most part whence a by Winds, which swell and stretch the Pain all owhole Extent of the Guts; whereby vio- ver the lent Undulations of the Spirits are made at one and the same time from almost every individual Part of them, up to the Brain: It may also be occasion'd by the Irritations of Crudities and Indigestions; by Sower or Corrosive Humours discharg'd from the Blood; by the Humours of the Gout, Scurvy, Rheumatism, &c. tranflated from other Parts upon the Guts; or by the Overflowing of the Gall into them. Any of which Causes affecting the whole Extent, or greatest part of the Guts, will occasion violent Undulations of the Spiits from innumerable Places at once up to the Brain, and consequently a Sensation of Pain, indistinctly referable to so many Places, that it seems to affect the whole Circumference of the Lower belly.

one particular Bowel, or some one Distinct Part of the Guts; whereby violent Undulations of the Spirits are continually made from that Part only up to the Brain, The manner how a fixt Pain bores like an Augre, has already been explained.

A moving Pain of the Cholick.

The Pain of the Cholick, which, being fixt for a while in one Part of the Belly, removes on a sudden, and is felt in another Part of it, and thus often changes its Situation from Place to Place, is occafion'd by Winds, Indigestions, or Morbid Humours contain'd within the Cavities of the Guts; which being stopt for a while by their Valvules in one Part, then forc'd by their Vermicular Motion into another, where the like Valvules stop them again; their violent Action upon the Nerva causes the Pain to be felt in that Part to which they remove, and wherein they are stop'd.

From Sensation of something bind-

The Texture of the Colon is particular whence the larly remarkable, as different from that of all the other Guts: for besides its exterior Membrane; (which I take, and a very ing the Bel- Learn'd Author (a) affirms to be the Ex ly or Guts. pansion of the Pleura, not of the Perito naum, as is generally imagin'd) the Long

and Orbicular Fibres; the Nervous Coat; and Glandulous Membrane, which are common to it and all the other Guts; it has also a Ligament of Fleshy Fibres about half a finger broad, running along its whole length, and many Orbicular Ligaments which from space to space divide this Gut into little Cells or Cavities, resembling a Glass Incorporator; the use of which is, to retain the dissolv'd Aliments, 'till all the Chyle is absorb'd into the Lacteals. For 'tis matter of Fact that they pass quick thro' all the other Guts. which are generally found empty, and make the longest aboad in this. Now if the Fibres of these Orbicular Ligaments happen from any Cause to be put into violent Contractions or Convulsions, 'tis manifest that they will bind and streighten the Cavity of this Gut, in the same manner as if so many Cords were ty'd hard round its outside, and occasion the like violent Undulation of the Spirits from those Parts up to the Brain, as a Cord ty'd hard round any outward Part will do: whence the Soul, which had clear Ideas of the Causes which bound the outward Parts, and of their manner of acting, imagines from the simular Undulations of the spirits up to the Brain, that a like Cause ffects the Inward Parts, of which she has no clear Idea; and thinks that some

matter of Fact is undeniable, many Authors testifie it, and I have met with it more than once my self. But why such violent Contractions or Convulsions should happen to these Muscles in the Cholick, and to no others, is not easie to account for. The most mechanical way of doing it, is to suppose, that, as this seldom happens, 'tis only in those Cholicks, which are occasion'd by Viscid, Glutinous Humours, impacted and adhering to the Coats of the Guts; and that the Blood partakes of the same Viscidity, whence the Copula Explosiva separated in the Pores of the Muscles for their Contractions, becomes also more viscid and glutinous than naturally: This granted, I say the Reason why these violent Contractions or Convulsions happen to the Muscles of the Abdomen, and to no others, is because the Spirits undulating, with Violence from the Guts affected, back to the Brain, are determin'd by their Angle of Incidence to flow precisely into the Muscles of the Lower-belly,
where meeting with a Copula Explosiva prethe ternaturally viscid and glutinous, the niroaerial Particles of the Spirits cannot cause that sudden Explosion they are us'd chem crement of the Blood duly constituted, whereby both are soon attenuated into seth esser Particles, and evaporated partly into

the Blood, partly into the Air, thro' the insensible Pores of the Body) but make a Swelling and Rarefaction in the Pores of their Fibres, like to the Fermentation of Dough; by which these Muscles are kept in one continu'd Contraction or Convulsion for a long time together; and thereby it is that they press all the loose Parts contain'd within the Lower-belly upwards, and become themselves almost contiguous That a violent Irrito the Back-bone. tation of the Guts determines the Spirits to flow by their Angle of Incidence into the Muscles of the Abdomen, preferable to those of any other Part, seems very probable from the Mechanism of Vomiring, where a violent Irritation of the Stomach, which is of the same Structure, and but one continu'd Substance with the Guts, always determines the Spirits into the Muscles of the Abdomen; and that this Determination is made by an Angle of Incidence, I have endeavour'd to prove in a former Treatise of Vapours, from pag. 46 to pag. 61. 2d Edition.

Sharp and Burning Belly how occasion'd.

The Sharp and Burning Heat in the Belly, which often accompanies the Cho-Pains in the lick, proceeds either from an Inflammation of the Guts, which is so frequent in this Distemper, that (as I have shewn in the foregoing Chapter) it feldom or never is without it; or from the Overflowing of

the

tha

lity

the

 $M_0$ 

and

tity

the Gall into the Guts, whose Acrimonious Salts, irritating and corroding their Coats, cause a Hot and Burning Sensation in them; this latter I take to be the more frequent Cause of that Heat; for though the Guts are seldom or never found without an Inflammation, in inveterate Cholicks, it does not thence follow that it must happen at the beginning of it, nor is it likely it does; and yet this Heat in the Belly is frequently felt at the first Invasion of the Cholick. But there are sufficient Grounds to believe that the Gall does for the most part overflow into the Guts, from the very first Onset of this Disease; especially when its Cause resides in the Guts themselves: For either Winds or Morbid Humours irritating them, must make the Spirits to flow with Violence, by the little Nerves of Communication from the Duodenum, into the Villi Fibrosi of the Gall-Bladder, whereby they being contracted will squeeze forth the Gall in greater quantity than usual into the Porus Cholidocus, whose oblique Insertion into that Gut renders it a Mechanical Necessity, that at every Dilatation succeeding the Contractions of the Duodenum, the Mouth of the Porus Cholidocus must open, and pour forth into the Guts, what quantity of Gall was contain'd in it.

Costive.

#### Explanation of the Symptoms

Costiveness from whence.

8

Costiveness proceeds either from the Inflammation of the Guts, or from a preternatural Heat in the Bowels; by which the Excrements are dry'd and bak'd into hard Balls within the Cells and Cavities of the Colon; and as these Balls, form'd after the mould of those Cells, are broader in the middle than at each end, they are thereby detain'd by the Orbicular Ligaments of the Colon, with a force Super or to that of the Vermicular Motion of the Guts, which us'd to expel them out of the Body when Liquid or Soft; and as the fresh Excrements supply'd from the Food, are stop'd by these hard Balls in the Colon, they by the Heat and Evaporation of their Serous Particles do also grow hard, and distend the Skins of the Guts with that Violence, they become incapable of Contraction, and consequently of protruding forth the Excrements by Stools. Another cause of this Constipation is, the Distention of the Guts by Winds, which swelling their Coats violently outwards, very much La lessen, or totally hinder that Vermicular Motion of them, by which Stools are aln occasion'd. Worms gather'd into Knots; large Stones in the Guts; or the Pressure and of a Tumour or Excrescence upon any Part or of them, may stop the Excrements from a descending, and thereby occasion this Con-aste stipation.

A Fever is properly described to be a Description violent Commotion and Heat of the Blood, of a Fever accompanied with an extraordinary Frequency of the Pulse, and a Depravation, or Lasion of the natural Functions of the Body. This may happen to the Cholick from almost any of its Causes.

For all sorts of Crudities, Indigestions, Causes of and Morbid Humours, whether volatile it in the or fix'd, being Heterogeneous (that is of Cholick. on a different Nature) to the Blood, may after repeated Circulations and Divisions

augment-

augment its Ebullition; Inflammations, Impostumes, Ulcers, or Cancers, may supply Acrimonious Particles to inflame the Blood; in fine, every thing that causes much Pain may create a Fever. For Pain being the Effect of violent Undulations of the Spirits up to the Brain, it follows that they must thence flow in greater quantities into other Parts of the Body, and mixing with the Blood augment its Ebullition; but when the Cause of Pain is feated in the Lower-Belly, the Spirits are thereby more immediately determin'd into the Liver, whence more frequent Contractions of its Fibres, and a greater Secretion of the Gall into the Duodenum than usual and requisite, will ensue. And as an Effusion of too much Gall into the Guts, will by its Irritation occasion new Determinations of the Spirits up to the Brain, from whence they flow again into the Blood; and will also render the Chyle Acrimonious, both these concur to augment the Fermentation and Ebullition of the Blood, and en ion crease the Feaver.

The Mechani m of the frequency in the Pulse.

But how, and by what Mechanism, this look extraordinary Fermentation of the Blood The causes a preternatural Frequency in the Pulse, is what no Body that I know of, has satisfiest factorily accounted for. Willis (a) says that ing

the Brood boiling with Impetuosity is hasten'd forward by a vehement and Quick Pulse, least too great a Quantity of it in the Heart should cause a Suffocation. Which is at most but assigning a final Cause, without explaining the manner how 'tis produc'd; which I account for

thus,

t

n

e

•

ill

The Pulse cannot be more Frequent, but because the Heart squeezes the Blood into the Arteries (and thereby elevates them) at quicker Intervals than usually; the Heart can't effect this, but by its own more frequent Contractions; and the Reason why its Contractions are more thort and quick, or frequent, is because the extraordinary Fermentation of the Blood has attenuated and volatiliz'd the Sulphurous Alkaline Recrement, or Copula Explosiva, (which, together with the Nitro-aerial Particles of the Spirits, lso causes the Contractions of the Heart) to that Degree, that it presents itself oftner, atienters more easily, and makes its Exploenters more quick and sudden, than it us'd to
to in the natural Constitution, when the

this lood was calm.

Thirst, Restlessness, and Want of Sleep,

ed,

ted, and not in the Stomach, as Willis (a), and all Authors, I have hitherto met with In Proof of which 'tis sufficiimagine. ent to alledge, that this Sensation is always referr'd to the Mouth; consequently the Soul, the best Judge of our Senses, knows that to be the Seat of it. Nor is the Reason alledg'd by many Authors, viz. That one then finds the greatest Relief from Thirst, when the Water drank is got down into the Stomcah, of any Force: For it only proves that the Water being detain'd there, and affecting a large Circumference, induces a more grateful Coldness in the Stomach, (wherein there is also much Heat, tho' no Thirst) than it does in the Mouth or Throat, thorough which it passes quick, without making a ny Stay: And if that were allow'd for a good Reason, it might as well be pretend ed that the Organ of Thirst is seated in the Hands and Legs, fince 'tis Matter of by Fact, that by Bathing them a confiderable Br time in Water, you may thereby alleviate p Thirst; which is ever occasion'd by the Concretion of the Sulphureous Earthy and an Saline Parts of the Spittle, which being chrystaliz'd into great Molecules, irritate wh the Nerves of the Mouth and Palate with that

that particular Sensation of Heat and Dryness call'd Thirst. Now this Perception is incident to the Mouth and Palate, preferable to all other Parts, because besides the Dryness and Heat they partake of equally with the rest of the Body, the hot Air constantly expir'd from the Lungs not only dries these Parts more, but puts the Concreted Salts of the Spittle into a greater Motion, than the like Concreted Salts of other Humours do acquire elsewhere; whereby the Nerves of these Parts ere more irritated, and the Perception of Heat and Dryness becomes more intense, and of a different Sensation in the Mouth and Palate, than elsewhere.

When a Feverish Disposition accompa. Restlessness ga nies the Cholick, the preternatural Fer-what, and mentation of the Blood will occasion Di-how caus'd. end tentions of innumerable little Fibres in many different Parts of the Body; where-Brain with some Violence; whence Small Pains will ensue, answerable to the Cause, which does not act with extream Violence: and because these Pains are general all over the Body, the Patient not knowing what particular Part to refer them to, with turns himself from Side to Side, thereby to that find some Ease, which not obtaining his Mind is troubled at it, and that Untasi-Mind is troubled at it, and that Untafiness

Sleep, what, binder'd.

As Sleep consists in the Subsiding, Unaction, and Repose (a) of those Animal Spirits, which flowing from the greater Brain, are and whereby the Instruments of Sensations and voluntary Motions, what soever hinders that Calm and Quiet in them, will prevent Sleep, and keep the Patient waking. This may happen in the Cholick from many Causes, For the Feverish Disposition and Heat of the Blood, creating a Restless Uneafines in all Parts of the Body, protrudes the Spirits with a constant and unusual Violence up into the Brain, whereby they are kept in a preternatural disturb'd Motion, opposite to that Quiet and Repose in them necessary to Sleep. But it happens here chiefly, from the sharp Sense of Pain felt in the Cholick, which as it continually forces the Spirits with extream Violence up to the Brain, not only augments their Motion within the Brain itself, but also protrudes them down the Nerves into all the Organs of the Senses, whereby those Organs are kept stretch'd, and capable of receiving the Impressions of outward Objects, which is the same thing, in other Words, as to remain Awake.

Sharp, Sower, and Bitter Tastes, are not sower or permanent and durable Symptoms of the Bitter Tafts Cholick; but what happen now and then, from whence. from the belching up of Fumes of different Natures. They are Sharp, or Sow'r, when the Digestion is vitiated by too great a Quantity of Acids; and Bitter, when the Gall overflows into the Stomach: Or, as the Jaundice is an Accident frequent in this Distemper, it may then happen that too great a Quantity of Gall is mix'd with the Spittle, which will occasion a Bitter Taste in the Mouth.

Vomiting happens, when either the Gall Vomiting. overflowing into the Stomach, or the Salts of Crudities and indigested Aliments prick or corrode its Nervous Coat; whereby violent Undulations of the Spirits being made up to the Brain, and from thence by the Angle of Incidence into the Diaphragm and Muscles of the Lower-Belly; those Antagonist Muscles (whose Motions us'd to be alternate and successive) are contracted with Violence at one and the same time, and thereby press the Stomach, which lies between them, into a narrow Compass, and forcibly eject what was conher tain'd in it thro' its superior Orifice, which is dilated at that time by the Contraction arp, of the Diaphragm; whilst the same Contraction, pressing down the Liver upon its By lower Orifice, hinders any thing from passing

paffing downwards. The Proof of which Mechanism I have formerly given at large in a Treatife of Hysterick Fits, from pag. 46. to pag. 66. Second Edition.

Belching.

Belching proceeds from a Rarefaction of the Aliments into Winds; which being pres'd from Side to Side by the Contractions of the Muscles of the Abdomen and Diaphragm, and help'd by their own E. lasticity, force their Passage where 'tis easiest; and when the Contraction of the Diaphragm opens and dilates the superior Orifice of the Stomach, and by preffing down the Liver shuts the Pylorus, then they rush out with a Noise and Violence thro' that upper Orifice into the Throat and Mouth.

Heat and the Urine.

The Heat and Sharpness of the Urine, Sharpness of when they happen in the Cholick, are occasion'd by the Inflammation of the Colon, which adhering to the Kidneys, communicates its Heat to them; whereby the Salts of the Urine being exalted, become capable of making violent Impressions upon the Parts, thro' which it pal-As we see it constantly happens in Gonnorrheas, where the Inflammations of the Proftata, or of the Seminary Vest cles, imparting their Heat to the Urine in the Bladder, make it sharp and scalding.

A Beating in the Belly, like to a strong A Beating Pulse, whether painful or not, is always in the Belly occasion'd by an Anevrisme, or extraordi- strong Puls. nary Dilatation of the Great or Caliack Arteries, whence the Pulsation, or successive Elevation of those Arteries is so strong, as to be sensibly perceiv'd: For, tho' I know that the Obstruction or Dilatation of smaller Arteries, may and do often occasion the like Beating in outward Parts; yet I am of Opinion, that none, but these Great Arteries, are capable, from any Causes of making their Motion, be felt thro' so many Parts, and the thick Muscles of the Abdomen.

pal.

The Pain frequently felt in the Loins, is Pains in the occasion'd by a violent Distention of the Loins, from Muscles of the Abdomen, whose Tendons, which are their most sensible Parts, being Affix'd to the Vertebra of the Back-bone, in that place we call the Loins, or Small of the Back, hence it is the Pain is felt there. And the Difficulty the Patient inds, to stoop or bend forwards at that ime, arises from the greater Distention of those Muscles by endeavouring it, wherey the Pain is encreas'd. This Pain is reerr'd to neither Side in particular, but to ne in he whole Loins, or Small of the Back ng. general, because the same Number of endons are affixt to the Vertebra on each ide, and being all equally stretch'd, are

con-

consequently equally affected with the Pain. When Pains are felt in the Right or Left Hypocondria (or Cavities under the Short Ribs) they proceed from other Causes.

Hypocondria.

Pains in the That in the Right Hypocondrium from an Inflammation, or the Irritation of any Bowel or Part of the Guts situated there, or from the Distention, Pressure, Weight of the Liver. That in the Left Hypocondrium, from the like Inflammations or Irritations on that Side, or from the Distention, Pressure, or Weight of the Spleen. If I here make a Digression by way of Enquiry into the Use of this A Digressi- Bowel hitherto unknown, it can't be en the Use thought foreign to my present Subject; fince the Cholick, as I have already shewn is often occasion'd by its Vices and Alterations.

A Description of the Parts and the Spleen.

The Spleen is a fost spungy Viscus, of dark red or blueish Colour, about six la Structure of ches long, three broad, and one thick; fi tuated in the Left Side, between the Spurious or short Ribs, and the Stomach adhering to the Stomach, the left Kid ney, and the Diaphragm; externally co ver'd with two Membranes or Skins, in ternally divided into a vast Number Cells or Cavities, communicating like a Honey-comb with one another, which the Ramifications of the Splenetic fro Artery terminate, and pour forth th Bloo

Blood. The Infides of these Cells are furnish'd with many little white Glands, to cvery one of which a capillary Artery is distributed; there is a multitude of strong Fibres, which cross the interiour Substance of the Spleen from Side to Side; some of which reach from its outward Membrane to the Cells; others are subdivided from Fibre to Fibre, or from Fibre to Cell, and some run only from Cell to Cell. These serve as Beams, and Iron Cramps do in a House, to strengthen its Fabrick; and it is thereby made capable of Contraction, as its exteriour Membrane is of Dilatation. There is a manifest Anastomosis, or immediate Communication between the Vcins and Arteries, in this Bowel. Its venous Ducts are beyond Comparison larger and more capacious than its Arterial ones. is always fill'd with a greater Quantity of Blood, than any other Part of the Body, which is concreted into such a Jelly, that at first Sight it imposes upon the Eyes for a Fleshy Substance, tho' by a small Agitation it may soon be reduc'd to Fluidity. It does not receive this Blood into capillary Veins, which by their Union form many Branches, and at last terminate into the Ramus Splenicus, but by a Structure and Mechanism peculiar to it self, its Cells terminate in one short and large Vein, from whence all the Blood is convey'd by the

in

the Splenick Branch into the Vena Porta, and thence into the Liver. It is moreover remarkable that the Lymphaducts range only within its exteriour Membranes, but do not penetrate into its Substance; that the Spleen has many more Nerves in proportion than any other Part of the Body, which are larger, the nearer they approach to, and for some Space within its Substance; that its Veins and Arteries have more Coats than those belonging to other Parts; and that the Splenick Vein comes forth, close to the same Place where its Artery enter'd: so that the Blood is not carried in a progressive Motion from one End of this Bowel out at the other End of it; but all of it returns back again, to be carried off at almost the same Point it enter'd in.

Uses of the Spleen.

From this exact and particular Description of the Spleen, I shall endeavour to account for its Uses, which I take to be 1st, To give a Consistence to the Blood, thereby to preserve it from that Dissolution, Disunion, and speedy Destruction, which a constant Division, and uninterrupted Fermentation soon induces; as we see it daily happens in continual and Hectick Fevers: 2dly, To dispose the Blood, by that Consistence of it, for the Separation of the Gall in the Liver: and perchance, 3dly, To serve as a Receptaritie cle

the

COI

W

Ch

wit

vey

cle, or retiring Place to part of the Blood in all violent Motions and Contractions, whereby it might otherways burst the Blood-vessels.

That the Motion of the Blood is les- Proofs that sen'd, and it acquires some Consistence in the Spleen the Spleen, is very probable, if not clear-gives a ly evident, from the following Matters sistence to of Fact (and Matters of Fact are what I the Blood. love always to reason after, and to draw my Consequences from, where possible; being satisfied 'tis the readiest Way to Truth, and to what Certainty of Knowledge Humane Nature is capable of). First then by Diffections we always find the Blood in the Spleen more concreted than that of any other Part, and form'd into such a Jelly, it resembles one entire piece of Flesh. 2dly, This Blood is of a darker Colour than any other in the whole Body; which is known to be a certain Consequence of a Diminution of Motion in Liquids. 3dly, The whole Structure of the Spleen feems manifestly dispos'd and with less Rapidity; so the Blood conthe vey'd into the Spleen, flowing from the the little arborous Ramifications of the Spleand nick Artery, into large Cells and Capta vities, must necessarily subside within it cle G 3

ru-

felf, and abate of its Motion. Add to this, that there is a fix'd acid Recrement continually separated into this Blood, from the many White Glands plac'd within these Cells, White Glands whose Nature it is to coagulate Sulphurous within the Liquors, and consequently the Blood. That Cells of the something is separated thro' these Glands Spleen; their Use and the is plain, because Nature makes nothing in Nature of vain, and little capillary Arteries are vitheir Refibly distributed to every one of them; crement. consequently they are design'd, as all other Glands, for the Separation of some

carried to them.

Experiments proving the A-

ment is of a fix'd acid Nature, will appear, from its Effects and Taste. For tho, as Glisson observes, the Blood itself in the Spleen does not taste acid; yet, if when eidity of this the Blood is drain'd out of it, its glandu-Recrement. lous Vesicles are apply'd to the Tongue, an acid Taste will easily be perceiv'd: Likewise from its Effects, because if you mix new Milk with the Recrement squeezed out of these Glands, a Chagulum will thence arise; and if you inject a Laver of Soap into a Spleen almost cleans'd of its Blood, you shall sooner burst its Cells than force it to pass, tho' Water will at the same time pass freely thro' it: The Reason of which I take to be, that the fix'd Acids of this Recrement, join'd to the Sulphurous and Saline Particles of the Soaps

Recrement out of that Blood which is

And that this Recre-

Soap, form a Vitriolick Salt, which contracts the Fibres, and closes up the Cells of the Spleen. As I have not yet had the Opportunity of making this last Experiment upon more than two Human Bodies, (tho' in both of them I observ'd what I here mention) therefore I won't affirm it for a Fact sufficiently grounded; tho' I believe it true, and what will constantly happen. But the acid Taste of this Recrement, and its coagulating of Milk, are undoubted, both from my own Experiments, and those of Malphigius (a), which without the other are sufficient to prove its Acidity.

A further Proof of this Confistence, which the Spleen gives not only to the Blood in the Liver, but also to the whole Mass, is drawn from the Experiments I have often made of cutting the Spleen out of Dogs; after which they constantly became more lively, brisk and active, more ravenous, ran more after Bitches, and pis'd more frequently; all which clearly evince a greater, livelier, and brisker Fermentation in the Blood, consequently that it sermented less whilst the Spleen perform'd its natural Function. Whence I conclude, that one Use of the Spleen, is to abate and lessen G 4

lessen the intestine Motion or Fermentation of the Blood; the final End of which probably is, thereby to preserve its Vigour, and prolong the Life of the Animal. I formerly cut the Spleens from feveral Dogs, to try if I could thence make any Observations to corroborate this Conjecture; but the Remarks I made were too few, and too uncertain to be mentioned, tho' they ferv'd to confirm me-more in the fame Opinion. This I take Notice of, only to put others (who have the Curiofity and Leisure) upon the same Experiment; whereby if they constantly find, that those Dogs are more brisk and ravenous for the first Months, and afterwards pine and waste to Death much sooner than is natural, (as it happen'd to some of those I made the Experiment on) they may thence conclude, that, as 'tis evident the Want of the Spleen occasions a greater Fermentation in the Blood, so that Fermentation always does, (as it now seems both reasonable and probable) advance the entire Dissolution of it, by the uninterrupted Division of its Salts; and thereby shortens Life. Note that those who make this Experiment, ought, (which I omitted) to shut up these Dogs from Bitches, because their running so much after them, may otherways occasion, at least in Part, that Decay, which I imagine will prove mented and unint rupted Fermentation of the Blood, which is what we endeavour to be satisfy'd of by the Repetitions of

this Experiment. The 2d Use I ascrib'd to the Spleen was That the to prepare and dispose the Blood for the spleen pre-Separation of the Gall in the Liver. And pares the we see in Chymical Operations, that Blood for the Separa-Precipitation is the Method by which Art tion of the makes a Separation of Particles to form A-Gall. crimonious Salts; so it is not unlikely that Nature makes a Precipitation from the That the Blood in the Spleen, thereby to form those Method of its doing it is Acrimonious Salts of the Gall, which are by Precipisterwards separated in the Liver. To an tation. rtificial Precipitation three things are requir'd; 1st, that the Salts obtain a suffidient Dissolution, by a proper Menstruum; dly, that this Dissolution be contain'd in large Vessel or Recipient. (Chymists lways make use of such a one, as has its only Orifice in its Superiour Part.) 3dly, hat a Dissolution of some fixt Acid Salts e pour'd upon it; from whence arises, a fermentation in some Liquors, but in most Coagulum, by which the Precipitation is pade, and an acrimonious Salt separated. low is there not a sufficient Dissolution ade of the Salts of the Blood, by its na-

tral Fermentation? Is not the Spleen a

spacious Vessel or Recipient, almost of

the very form Chymists would chuse, with both its Orifices implanted together in its Superiour part, and no Passage at the bottom or else-where; whereby it seem purposely contriv'd to detain the Contents and allow time for the Salts to subfide? there not a fixt Acid separated from the inner Glands of its Cells? don't we ob ferve the Blood in it to be of a dark colour and coagulated almost to a Jelly? and we certainly know that an Acrimonious Sal is soon after separated from this same Blood and carry'd immediately into the Liver Why then may not we with some reason conjecture, when so many things are Si mular, that Natue effects a Precipitation here, much after the same manner as Ar does elsewhere? But let us fix upon som one Artificial Precipitation, and see how near we can bring the Parallel of it, to what happens in the Spleen.

I take, for example, a quantity of Sal Comparison of Saturn sufficiently dissolv'd, which I pu of Artificiinto a large Recipient or Vessel, then al Precipitations, to pour Oyl of Tartar per deliquium drop b a natural one suppos'd drop upon it, whereby a Coagulum is so induced in the Liquor; and by giving to be made in the Spleen. time to repose and subside, a White Por

der is precipitated, or finks to the botton er After which, by shaking it, I remix tho nd! precipitated Salts with the Liquor; the orta filtrate it through a brown Paper; where

by the Liquor passes clear, and the Preipitated Salts remain upon the Filtre. Vature seems to act almost step by step fter the same manner, when she conveys much Blood, (in which there is unoubtedly a great quantity of Salts suffiently dissolv'd) into the blind Recipient Cavity of the Spleen; where the fixt cid Recrement of its Glands, instilling rop by drop, like my Oil of Tartar, upon , induces a Coagulum in this Blood, aparent by Dissections to the Eye. tructure of this Bowel, (wherein the lood flows out of narrow Channels into such larger Cavities, and has thence no ay of Reconveyance, but up thro' a hall Orifice plac'd in its superiour Part) contriv'd for that Delay and Repose of he Blood in this Vessel, which is necessato its subsiding, and the Precipitation fits Salts; and the Contraction of the I pu Iransverse Fibres succeeding the Repletion nen and Distention of the Spleen; its Pressure p b gainst the Ribs made by the Guts and owels of the Lower-Belly, in the Moons of Expiration (the Mechanism by
hich Nature helps this languid Blood to
aftend into the Splenick Vein); togeher with the affusion of a more Active the id Spirituous Blood upon it, in the Vena her orte, from its right Branch; must inevibly exagitate it, and thereby probably occasion

occasion that remixture of its Precipitate Salts, which I effected in the Precipitate Dissolution of Saturn, by shaking Though 'tis to be observ'd, that the A tation or Remixture of the Precipitate Salts is not necessary to all Artificial Pro cipitations, many of which are made with out it, consequently may not be requis to this natural one. From the Vena Pon this Blood flows into the Liver, who Glands perform the Office of a Filtre, separating the Precipitated Acrimonion Salts, which are afterwards fent off in the Gall-Bladder and Gall-Ducts, while the rest of the Blood passes on in a fr course, through the Veins into other Part as the Watry Parts of the precipitate Dissolution of Saturn did through the Brown Paper.

There is another fort of Artificial President pitation, wherein 'tis necessary to add I wenty Parts of fix'd Acids, one Parts Volatile Salts: For Example, in making the White Precipitate of Mercary, we add half an Ounce of the Volat Spirit of Salt Armoniack, to a Dissolution of Ten Ounces of Marine Salt pour'd upon on the Mercury. And if you require the like Volatile mixture in this natural Precipitation, you may very rationally supposed it to be supply'd, either from that more active Spirituous Blood, which flowing the salt of the salt pour'd upon the salt of the salt pour'd upon the Mercury. And if you require the salt pour'd upon the salt pour'd upon the salt pour'd upon the salt pour salt pour

from

om the Right Branch of the Vena Porta, incorporated with this Blood before it ters into the Liver; or from the Spirits the Spleen has confiderably more erves in proportion than any other Part) pply'd to and mixt with it, in greater

From what has been faid, I am of pinion, with submission to better Judgents, that the hitherto unknown use of e Spleen, is to interrupt the Fermentation the Blood; and to effect a Precipitation its Salts; by the former to prolong fe, by the latter to prepare the Acripnious Particles of the Gall, for their paration in the Liver. I was led into ese Thoughts by various Experiments, d a serious Attention to the whole ructure of the Spleen, every way diss'd to these Ends; which induce me to ddt lieve that the long deviated Course of the art oplenick Artery (whose Diameter is also make uch larger than that of the right branch the Cæliack) was contriv'd to abate described lessen the Motion of the Blood in its nveyance to the Spleen; where its Effudupon into a large Cavity dispos'd into mae the Cells, does by a Mechanical necessity fien that Motion considerably more;

d the subsequent mixture of the fix'd cid Recrement from the Glands plac'd win ithin these Cells soon Coagulates it:

dubioufly asterted.

By which, and the requisite Delay or Ro pose contriv'd for it in the Cavity of the Spleen, the Precipitation of Acrimonion Salts from the Blood is effected: Which being carry'd thence, immediately im the Liver, are there Filtrated through Glands, and form the Gall. Whosoever will be pleas'd to compare this Hypothe with the many different ones of the under cited Authors (a) (who are all I have h therto read on this Subject) may them judge, which seems to him best grounds upon Reason and Experience. To me, m one of theirs is in the least Satisfactory nor is my own so clear and evident, as make me flatter my self, I have ful demonstrated the true Use of this Pan yet it appears both probable, and is what I hope to illustrate more and more future Experiments.

A third Use of the Spleen, is, in the A 3d Use of the Splen Opinion of a very learned Man, to fer for a Receptacle, or Retiring Place to par of the Blood in all violent Motions; there by to prevent the Rupture of the Blood Veffel

Vessels. For as in violent Contractions he Blood is press'd from the outward. nto the inward Parts, and the Spleen is a apacious Vessel, whose Cavity may be Ill'd, and its Skins stretch'd and distended tithout any Prejudice to it self or hurt o any adjoining Parts, it probably reeives more Blood at that time than usualy, because after violent Exercises we ways feel a Tensive Pain in the Left side, of where the Spleen is seated; which unoubtedly proceeds from the Distention f its Membranes. But I neither take his Use to be solely answerable to the Dignity of so principal a Part; nor do I ful believe that those, who shall think it what will find that the small quantity of Blood rebuhat it can receive over and above usually contains (being even soll) can suffice to prevent the Rupture of my Blood-Vessels in distant Parts of the Body, whatever it may possibly do in those land the painful here mmediately adjoyning. And the painful Distention of this Bowel, after violent exercises, may as probably proceed from the Raresaction of the Blood, as from the Repletion of the Spleen, by a greater

us. Repletion of it.

A Chilness, or Sensation of Cold when From

thappens in the Cholick, proceeds from whence the

Green trivation of Sensation of

rritations made by fix'd Acids, much in Sensation of

the same manner as 'tis produc'd in cold Fits of Agues; but when it seems as if a Cold Iron were run through the Belly, that ariles from a great quantity of fix'd Acid mingled with the Chyle; which flowing through the Vena Lactea into the Pancrea Afellii, and thence by the Secondary Lacte als to the Ductus Chyliferus, irritates the Fibres of their inward Skins, with a Sen sation not unlike to what we feel from the Application of cold Iron to any outward Part; and this Coldness being Progressive as the Motion of the Chyle advances through the Mesentery, induces the Ida of a cold Substance moving through the Belly. Cold Sweats are occasioned, by a defi-

Cold Sweats

ciency of the Spirts in the Excretory Sphincters of the Military Glands; where by that Serous Humour, which us'd to evaporate by Insensible Perspiration, find a wider Passage, and flows out in large Drops upon the Surface of the Skin Giddiness is also occasion'd by a like De Ci ficiency of the Spirits in the Emporium of the Brain, as I have more fully ex plain'd it, in a Treatise of Vapours, from Pag. 76, to Pag. 83. 2d Edition. And a this Deficiency of the Spirits will arise from any Cause that Coagulates the Blood f or considerably lessens its Fermentation, its will be frequent in those Cholicks that ared produc'

Giddiness.

produc'd by Indigestions, abounding with is a Kard Acids; which from the latter Cause that will occasion a Coldness and Paleness; cid from the former, Fainting Fits, or a Synreal and the Red Colour of the Face, proceeds from the lively Fermentation of the Blood, the whatsoever considerably lessens that in the Sen whole Mass, will lessen it much more rom in the extream Parts which are farthest ward from the Heart; whereby being depriv'd five of their usual Heat, they feel Cold. A Inco Paleness will likewise ensue, because there Idea not being a Fermentation in the Blood the sufficient to form, dispense, and spread in the Pores of the Cheeks, the usual quandeficity of Red Globules (by which the Rays here ication, which produc'd in the Eye the 'd to Perception of Redness) they lose their finds forid Colour, and become Pale and Wan. large But when these Acids thicken and coagu-Skin ate the Blood to that Degree, that its De Circulation in the Lungs, and through orium he lest Ventricule of the Heart is intery excepted, then Fainting Fits, or a Syncope Syncope or from hat is a Cessation of the Pulse and Breath-Fainting and a g for a short time, will ensue.

Convulsions are occasion'd by a mixture Convulsions Blood Heterogeneous Particles with the Spion, its, or with the Copula Explosiva separaat ared in the Pores of the Muscular Fibres;

H

duc'

whereby

whereby their Explosion becomes more violent and irregular: The latter of which Causes I take to be the most frequent, The Mechanism, by which the Muscles are contracted, and Convulsions caus'd, is deliver'd in the above-mention'd Book of Vapours, from Pag. 104, to Pag. 106, Second Edition.

Faundice.

As the Jaundice proceeds from the mixture of much Gall with the Blood and its Recrements; especially with that of the Corpus Mucosum, and the Humour, which nourishes the Conjunctive Tunick of the Eye; 'tis no wonder it should be frequent in the Cholick, where the Gall generally overflows in such quantity into the Guts, and is thence carry'd into the Blood, and all Parts of the Body.

How the Navel-String is drawn inwards or swell'd outwards.

When the Navel-String, and a small cir cumference round it, is drawn inwards; occasion'd either by Humour that is which stretch and distend its Cavity whereby as it swells in breadth, it is shorten'd in length, and draws that Circlin cumference of all the Muscles and Skin inward, to which its Infertion is made this Or else that the casual Pressure, and weigh of some inward Part upon it, bends it wit violence; and thereby draws that wholey Circumference inwards, to which it affix'd. What Swells it outwards can nothing but Winds, or watry Humou ous

But how the same Cause should occasion How hot violent Hot Pains in the Lower-Belly, and Pains in the at the same time a Lowness in the Pulse, and Belly, Cold in the Ex-Chilness or cold Sensation in the Extremi-tremities, ties, is what requires some Thought to ac- and lowness count for. Which Symptoms I take to of Pulse, be produc'd thus. The first Action of happen to-the indigested Chyle abounding with fix'd the Cho. Acids, is an Irritation of the Guts, by lick. which Irritation, both violent Pains, and the Overflowing of the Gall into them, are occasion'd. After which part of the fix'd Acids penetrate into the Glands of the Guts, which they obstruct, and Coagulate its Recrement; this coagulated Recrement rises after some time into a violent Fermentation, from the Heat of the Blood in the adjacent Parts, and thereby causes Inflammations; which are encreas'd by the great quantity of Gall overflowing into the Guts; from hence the Heat in the Belly. But as the greatest part of this indigested Acid Chyle, continuing its course, is carry'd through the Lacteal Vessels, into the Blood, that thickens the whole Mass, and by thickning of it occasions a Lowne's of the Pulse, and a Chilness or Cold Sensation in the Extream Parts; after the manner just above explain'd.

H 3

Having

## Explanation of the Symptoms

Having thus mechanically accounted for all the Symptoms and Accidents of the Cholick, I shall in the next Chapter proceed to its Diagnosticks; and deliver those Signs and Tokens, by which both the Physician and the Patient may discern, from which of so many different Causes any Fit of the Cholick proceeds.

#### CHAP. III.

The Diagnosticks of the Cholick.

A Cholick proceeding from Indigestions Signs by and Crudities, (taking the words in Cholick is a general Sense) is known by the Grumb-known toproiling of the Guts, frequent Belching, and ceed from Breaking of Wind backwards, by a Loose-Cruduies. ness; or that the Patient has taken Cold, or eat too much, or Aliments of hard Digestion.

When the Indigestions are of a Sower and Acid Nature; that is known by the Conference stitution of the Patient, by the Coldness Humours, of the extream Parts, the Concentration and Lowness of the Pulse; by a sleepy Disposition, and Heaviness in all Parts of the Body; by the Sharp and Sower Taste of what he Vomits; or from his having eat great quantities of Green Fruits, drunk green Wines, Cyder, or Sower Liquors.

The Cholick is known to proceed from FromWinds. Winds, when the Belly is stretch'd and Swell'd; the Guts grumble; the Patient breaks much Wind upwards and downwards, and finds Ease thereby; also when

H 4 the

the Pain moves in an instant from one Place to another. These Winds are distinguished to proceed from a slow Fermentation of the Crudities, when the abovementioned Signs of Sharpness and Sowerness in them are present, and the Swelling of the Belly is without the Sense of Heat. And from a quick and violent Fermentation in them, when the Swelling of the Belly is sudden, and accompanied with a preternatural Heat.

Retention and Hardness of the Exness of the crements; from the Constitution of the PaExcrements. tient, who is generally hard bound, and

goes naturally but once in three or four days to Stool; from his not having been at Stool of a long while; from the hardness of the Colon which may be felt outwardly; and that Astringent Remedies, violent Exercises, long Voyages at Sea, much Riding, or a Sedentary Life have preceded.

Sharp and Sower Humours discharg'd from Whereby known to be the Blood, upon the Stomach, Gurs, or other Parts within the Lower-Belly, occasion'd by (hart or may be guess'd at to be the Causes of Jower Huthe Cholick; from the Constitution of murs the manner of the the Patient, from discharg'd painful Irritation; and the above-given from the Blood. Signs of Sharpness in the Humours; when there are no grounds to attribute the

<sup>(</sup>a) Galen lib. 1. de loc. affect.

# The Diagnosticks of

By the Overflowing of the Gall.

The Overflowing of the Gall into the Guts, may be suppos'd to happen, and be reckon'd as a conjoint Cause of the Cho. lick, whenever violent Irritations are felt in the Gurs themselves; whereby a greater quantity of Gall will be always separated into them, as has been above ex. It may be gues'd to be the fole plain'd. Cause of it, from the Bilious Constitution of the Patient, the Heat of the Bowels not fix'd to any one Part; from the Fever, Thirst, Restlessness, Bitter Taste, Yellowness of the Urine, the Jaundice, Vomit. ing of Bilious Humours; and from what has preceded, as his having drunk great quantities of hot Liquors, eaten much spic'd or hot Meats, being put into Passion, or being subject to, if not actually affected with, the Jaundice.

That it is occasion'd by the change of By Atrabile, the Gall into what Physicians call Atrabile,

may be gather'd, (supposing the absence of other Causes) from the deep Melancholy Constitution of the Patient, from foregoing Accidents, as Passion, excessive Greet or Melancholy; but chiefly from the burning Heat in the Belly, whilst the extream Parts are Cold; by the hot dry Taste of what he Vomits; by the Lowness and Concentration of the Pulse, and that a Cadaverous Aspect or Facies Hippocratical comes on a sudden.

Worms, Lice, and other Insects, may be By Worms guess'd at to be the Causes of the Cho- or other Inlick, from the Age and Constitution of feets. the Patient. Children are generally troubled with them 'till fifteen or thereabouts; grown up People of a moist Constitution are more subject to breed them than others; and old People are more liable to them than those of a middle Age. The lick Paleness of the Face, greyish Colour of the Excrements, the Whiteness of the row Urine, Loss of Appetite, Vomiting, frequent and almost continual small pricking en Pains in the Guts or Stomach, more perfew ceptible after long Fasting, denote them.
But the only certain Sign is, when they Gall vomit Worms, or, what is more frequent, d at void them by Stools.

The Diagnosticks of

That 'tis Pestilential.

It is easily known when a Pestilential Disposition in the Air occasions the Cholick, by its being Epidemical; and its having the particular Symptoms observ'd to

accompany it.

By what from the Nephretick Cholick.

The Cholicks here treated of, are disigns known stinguish'd from the Nephretick Cholick (occasion'd by the Inflammation of the Kidneys, or by Stones or Gravel in them) by these Signs. In the Nephretick the Pain lies always fix'd and deep, on the right or lest Side of the Small of the Back, or in both; it does not mount higher, nor advance towards the Middle of the Belly, but descends down in an oblique Line towards the Bladder, and is always extended to the Back: other Cholicks are felt more forwards, more in the middle of the Belly, and higher up than the Kidneys. In the Nephretick the Urine is generally clear at the first like Rock-Water, afterwards deeper Colour'd, hath a Sediment, and is loaded with Gravel or small Stones In these Cholicks it is from the very beginning higher colour'd, thicker, more muddy than Natural. The Nephretick commonly occasions a dull heavy other Cholicks a more intente pricking, or hot Pain: And tho' sharp pointed Stones in the Kidneys often occasion acute cutting Pains, they are easily distinguish'd by the fixt Situation of then

most other Cholicks remove frequently from Place to Place; the Nephretick is ever fixt, and often occasions a Numbress in the Thighs, and sometimes draws up the Testicles. In most other Cholicks Vomiting is more violent and frequent, the Body more bound, and the Patients find more Relief by Stools and Vomiting, than they do in the Nephretick; in which the Swelling of the Belly, Grumbling of the Guts, and breaking of Wind seldom happen. The Taste of Urine in the Mouth is an undoubted Sign of the Nephretick.

Cholicks occasion'd by sharp and sower when from Humours discharg'd from the Blood upon sharp or the Guts, are verytroublesome and obstinate, sower Hubut seldom mortal; as Diseases proceeding charg'd from Acids, and the Thickness of the from the Blood, are least sudden and dangerous in Blood.

all Cases.

Cholicks occasion'd by Corrosive Hu-When from mours discharg'd from the Blood upon the corrosive Guts, are very dangerous; b cause they Humours. generally occasion Excoriations, and Ulcers.

Cholicks proceeding from the Trans-When from lation of the Humours of the Gout, Scur-the Humours of the Humours of the Humours of the Gout, when the Guts or Stomach, are dangerous, Scurvy &c. or not so, according to the Violence or Remissness of their Symptoms, and their ong or short Continuance.

Cholicks from the Overflowing of the When from Saul, are also dangerous, or not so, active Overflowing to the Violence of their Sympthe Gall.

oms, and from the danger of the Jaun-

ice, which frequently succeeds.

I 4 Cholicks

Cholicks from the Atrabile, or corro-When from

Atrabile. five Gall, are very dangerous.

Cholicks from the Gall's being imbib'd When from into the Coats of the Guts, Stomach, the imbibing of the &c. are very obstinate and dangerous, as Gall into generally occasioning Fevers and Inflamthe fleshy mations. parts.

When from Passions or Colds.

Cholicks occasion'd by Passions or Colds, are not dangerous; their Paroxisms are not of long Continuance; but their Returns

are frequent.

When from Stones.

Cholicks from Stones in any of the Bow. els, do not portend immediate Danger; but are very obstinate, scarce possible to be remov'd, and often kill the Patient by

a lingering Death.

Cholicks arising from the Growing toge. ther of Inward Parts of the Guts are incurable, and occasion speedy Death. This Case very seldom happens, tho' some Instances of it are attested by credible Authors.

When it affects different Colon.

When the Cholick affects the whole Extent of the Colon, 'tis more dangerous Parts of the than when it affects only some part of it. 'Tis least dangerous when it affects only the Extremity of the Colon from the Navel downwards; because Clysters easily reach thither: More dangerous when feated in the middle of the Colon; which is that part of it, that runs across under the Stomach, and thence passing by the Spleen, marches over the left Kidney; and most

most dangerous when residing in the beginning of the Colon; which lies on the right Side, and by a winding Course extends it self to the Liver; because Clysters can scarce reach so high, when this Gut is fill'd with hard Excrements.

In fine, all Cholicks are more or less dangerous, according to the Remissels and Intermission, or the long Continuance and Violence, of the Symptoms, which are sometimes insupportable, and force poor Mortals to put an End to their Pains by violent Deaths; as Galen (a) and other Authors testific.

CHAP.

<sup>(</sup>a) Galen. lib. 2. de composit. medic. cap. 1.

### CHAP. V.

The Cure of the Cholick.

#### SECT. I.

HIppocrates and Galen both assure us, that it is an easie matter for him to Cure any Distemper, who thoroughly knows the Nature and Causes of it (a); with much more Reason may the same be affirm'd of modern Physicians, because they have the advantage of innumerable experienc'd Remedies deliver'd fince by various Authors. Wherefore my chief Study and Care has been to establish the several Causes of the Cholick, and to remark by what Symptoms and Accidents each may be known and distinguish'd. What I deliver in this Chapter, shall be more the appropriating of approv'd Remedies to the proper Causes of this. Distemper, than the writing of new Prescriptions, which I never affected.

<sup>(</sup>a) Medicus sufficiens ad morbum cognoscendum, sufficiens est ad curandum. Hip.lib. de Arte. Promptissima sit curatio ab eo qui probé agritudinem agnoverit. Galen. 12. met. cap ult.

In the Cure of the Cholick three things are chiefly to be aimed at. Ift, To ease the present Pain. 2dly, To Strengthen the Bowels. adly. To remove the Cause. The Pain may be eas'd by Bleeding, which empties the Vessels, and lessens or prevents Inflammations; by Anodins and Narcoticks; and by Clysters appropriated to dissolve the Hard Excrements, and to discharge and carry off the vitious Humours. Bowels may be strengthen'd by spirituous and balfamick Ingredients mixt with Clysters and other Remedies, such as Diascordium, Turpentine, and Cordial Mixtures. And the Causes may be remov'd by several Methods which shall be heresfter deliver'd under each particular Head of the Cure.

y

bleeding, tho' not so requisite in habitual Fits of this Distemper, is proper in the begininng of most Cholicks, to prevent Inflammations which are very frequent, and always to be fear'd in this Disease: but it is more praticularly necessary in these three Cases. 1st, When there is a violent Heat or Inflammation in the Lower-belly. 2dly, When a Feaver accompanies the Cholick. 3dly, When there is a great flux of bumours upon any Part. And Bleeding is to be repeated, according to the violence of the Symptoms, where ever the strength of the Patient will allow

Carminative Clysters are most commonly improper, for they create those Winds they are thought to expel; they disturb the Humours; stretch the Fibres of the Guts, and augment the Pain, as Galen well

observes (b).

When the Heat is great, the Pain ex. tream violent, and accompanied with fie. quent Vomiting; Narcoticks are always to be mix'd with the Clysters; for 'tis matter of Fact, that when even gr. iv. vel v. Laudan. taken by the Mouth could not stop the Vomiting, the same quantity given in a Clyster has frequently done it effectually almost in an Instant. And tho' Sydenbam seems fearful of giving Narcoticks till the Humours have been prepar'd, and part of them carry'd off by one or more Purges, that Rule does not hold in this Distemper, because it is a true Observation that Purges seldom or never operate in violent Pains; and an experienc'd matter of Fact, that when the violence of the Pain is allay'd by Narcoticks, the same Purge shall work kindly afterwards which before had no effect. Wherefore after once

<sup>(</sup>b) Carminativa majores delores excitant. Galen. 14.
Meth. cap. 7.

once Bleeding, if necessary, and one Clyster, it will be generally proper to prescribe a Dose of Laudanum at Night, in one of these or the like forms.

Authors, that Narcoticks fix the Humours, (which I am far from being convinc'd of) yet I am of Opinion that when given in excess they do sometimes translate, and throw them upon the Nerves, and thereby occasion Palses to ensue on Cholicks; for which reason I think their use ought always to cease, as soon the Pain is well allay'd. But I would not have any one inferr from what I say, that the danger of an ensuing Palse is so great and certain, that the use of Narcoticks ought on that account to be omitted in the Cholick; for not only the violence of the Heat

or Pain, to both of which they afford the most certain and immediate Relief, but the Experience of Purges and Clysters working kindly after their use, when they did not before, do recommend them; and the Observations of the Antients shew their necessity in this Distemper (c). Next Morning repeat the Clyster, and give another that Evening, and a dose of Laudanum at Bed-time after its Operation But it is very carefully to be observ'd. that when the Patient is extream weak and in so sinking a Condition that you apprehend him to be near Death, Narco ticks in that case are not only beneficial but absolutely never to be given, for by stupifying the Spirits already languid and finking, they hasten or bring on immediate Death.

The second or third Day it will be generally convenient to Purge. The Medicine must be gentle, for violent Purge occasion a greater flux of Humours upor the Guts, (the Part most frequently affects in this Distemper) as Aetius, Paulus, Fonseca Fuchfius, and many others rightly observe

Galen uses only Lenitives in the beginning of this Distemper, and forbids strong Medecins (d). And for this End Rhasis (who has been followed in that Practice by many Moderns) mixes Narcoticks with Purgatives; which I think not so proper, as to give Narcoticks over Night, and a Purge the next Morning; my reason is, because Nacroticks mixt with Purges often hinder their Operation, and render them ineffectual. Of gentle Purges I take those to be most proper in the Cholick, that are given in a large quantity of Liquid, which both relaxes the Fibres of the Stomach and Guts, and by dissolving the Salts, lessens their Irritation. They may be order'd in any. of these, or the like forms.

Be Tamarind. ping. Ziss. coq. in s. q. aq. font. colatur. His. dissolv. pulp. Cass. recent. extract. Mann. calabrin. an. 3j. col. & fiat potio dividend. in tres part. equal. quarum capiat unam borâ. 6tà matutina, aliam bor. Rec 7må tertiam bor. 9nà interjecto jusculo.

<sup>(</sup>d) Que valde calefaciunt potius excitant ventos, mamas commovendo. Gal. xii. Meth.

## The Cure of

Syrup de Chicor. composit. & Cass. vel Man. an. 3j. misc. fiat Potio.

But if the Stomach be so weak, it can't bear a Purge in a liquid Form, we must necessarily then give it in Powders or Pills, thus

Re Pulv. Cornachin. 3j. vel 3ss. capiat in vehicul. commodo.

R Calomelan. gr. xv. vel Ij. Resin. Ja. lap/gr. vj. capiat ex cochl. j. juscul. vel alterius vehicul. commod.

If Powders prove also offensive to the Stomach, they may be made up into Bolus's or Pills, with the Conserve of Roses, of Burrage, or of Orange Pills, which last generally makes them fit best upon weak Stomachs; or you may prescribe any of the following Pills according to the Strength and Disposition of the Patient.

Be Pillul. Rudii 3ss. vel Jij.

Be Pillul. Coch. major. Bij. vel 3j. or,

Be Pillul. Coch. minor. 31s. vel 3ij.

The first of which Prescriptions is most recommended in this Distemper by Willis the last most approv'd of by Sydenbam.

men

But if even Pills themselves won't stay upon the Stomach, you must then give a dose of Laudanum, and the Purge eight or ten Hours after it; which (especially if in the form of Pills) generally succeeds well. You must always give a dose of Laudanum at Night after the Purge, to appeare the Commotion it has rais'd in the Blood, and to prevent any discharge of Humours upon the Guts from its Effects.

If the Patient be Sick at his Stomach. Vomit him with a large quantity of Lukewarm Posset-Drink; of Fat Broth; or of Oyl and Water mixt together: Violent or stronger Vomits are seldom proper, for the same reasons that we forbid strong Purges; and the more because they draw a greater discharge of Humours upon the Stomach and Small Guts, and thereby often turn the Cholick into a Miserere or Iliack Passion; Wherefore they are never to be given but in an extream Necessity, and manifest Indication for them; that is when the Cholick is occasion'd by an Excess in Diet or Surfeit, in which case even the strongest Vomits are to be given.

3,

st

ik

th

Fomentations of the Belly with hot Oyls, and several Decoctions, recommended by various Authors, are not to be apply'd without very great Caution: for they often put the Humours into Motion, augment the Heat and Inflammation, and yet

K 2

make

make no discharge; upon which accounts they are less us'd by the best Physicians of these Days, and caution'd against even by the Antients themselves. (e.) Not but that they are sometimes beneficial; to wit, when the Pain is almost insupportable, lies outwards, and is accompanied with a violent Tension of the Belly, a Phlogosis or Disposition to an Inflammation. In which cases after Bleeding, and Emollient Clysters; Emollient Fomentations, and sometimes Hot Oyls, either in Bladders, or having Flannels dipt in them, are apply'd with very good Success. The following are what I have in different Cases us'd with the best Success, and should most recommend.

Flannel, or a Thin Woollen Cloth worn next to the Skin, and covering all the Belly, is a lesser kind of perpetual Fomentation, recommended by Galen and others; and is sometimes useful in habitual Cholicks, especially in those that proceed from Cold, or Weakness, or from the defects of the Caul; but of no use in Accidental Cholicks, or to the cure of a Paroxism.

Bathing, tho' very beneficial in the Nephretick, has seldom good Success in Humoral Cholicks; and Willis (f) observes that both Bathing and Sweating, are prejudicial in them; but that Diureticks are

useful.

K 3

I

<sup>(</sup>f) Tho. Willis de Anim. Bruter. cap. 15.

I have but a very indifferent opinion of Plaisters in this Distemper; in which I can possitively affirm, I never yet experienc'd the least benefit to have accrued to the Patient, by the use of any kind of them.

Mineral Waters, and particularly those of the Bath in Sommersetshire, drank hot upon the place for six Weeks or two Months, are of all things the most beneficial and successful in Habitual Cholicks.

Cucurbitula cum magna flamma Umbilico imposita, recommended by Galen and many Authors, as what like a Charm eases the Pain in a moment, are not only disus'd by the best modern Physicians; but may and do sometimes prove of very dangerous Consequence. For if the Skins of the Navel should thereby be excoriated, it is a most difficult matter ever to heal them. For which reason, the Excoriation of the Navel was a Punishment us'd by the Agyptians to Criminals.

In the Cholick, the Patients Diet ought to be regular, and of things easy to Digest. No Flesh during the Fit, nor the Day sollowing. Green Fruits, Herbs, Beans, Pease, Cheese, Salt meats, Pyes, High Sauces, Pepper, Ginger, Hot Bread, and all Fish, by reason of the Sauce abounding with Butter and Spices, are to be avoided; as also the too great use of Sugar, in which there

Stipt

stina Sapor

que anâ must be sparing, with gentle Exercise, (if they are able) before, and Quiet after them. Small, early, and very light Suppers. Let their Sleep be protracted longer than usual; and their Bodies kept open, so as to go by Nature or Art, once in 24 Hours, to Stool. They must be warn'd to avoid as much as possible all Passions of the Mind, as GRIEF, ANGER, &c.

All Sharp, Sow'r, and Stale Drinks; Green or New-Wines; Champaign, Syder, Perry, Brandy, and Spirits, are prejudicial in the Cholick. Neither is Wine it self proper, unless mixt with much Water; Martianus, Riverius, Haferus, Akakia, and several other Authors, discommend its being drank alone, and assure us, that by the sole use of it, many have relaps'd into the Cholick immediately, and the Palsythere-by happen'd to others. But a small Draught of Sack or Malaga is allowable now and then by way of a Cordial. An Insusion K 4

<sup>(</sup>g.) Acidum esse corrosivum in Saccharo constat, quia succus ex quo Saccharum concrescit, extravasatus, intra breve tempus accescit. Et ex Saccharo distillare norunt spiritum Lusitavi, quem Aquadenti vocant summâ cum stipticitate refrigerantem, linguam constringentem, & intessina torminibus torquentem, metalla corrodentem, Nitrosi Saporis, simul & acerbum. Saccharum etiam, ipsum quoque dissolvit Antimonium, si nempe cum eo distilletur tridu-ana & levi destillatione. Piso.

of Rhubarb in cold Water, is an excelent Drink, in the Cholick, to which you may add a fourth or fifth part of Wine.

The eating of large quantities of Oyl, is proper and beneficial in almost all Cholicks, for it lubrifies and relaxes the Fibres. But it must not be much us'd by those who are not well accustom'd to it, least it prove Offensive to their Stomachs, and

spoil the Digestion.

The use of Garlick is good in the Cholick; every where ready at hand, cheap for the Poor, and is much recommended by Galen (b) and many Authors. It breaks the Wind without raising any great commotion in the Humours; it gently warms the Stomach and Guts, and is Diuretick. It may be boyl'd in Milk, Broth, or Beer; be swallow'd whole, or infus'd in White Wine, or Water.

Garlick so much recommended by Galen, as what breaks the Wind without raising any great Commotion in the Humours, is of good use here; and it helps to make a discharge by Urine. But I have never seen any good effects of Cucurbitula cum magnâ flammâ Umbilico applicata, also much recommended in this Case by Galen and many of the Antients; but on the contrary am very apprehensive of ill Consequences from their Use; and it is certain they can never carry off the Cause, tho' they may possibly give Ease for a time.

Warm Cloths ty'd hard round the Belly afford some Relief, because by their Compression they hinder the violent Distention of the Guts, and slacken the painful Dilatations of the Muscles of the Abdomen. Add to this that by the new Sensation of Warmth they give to the Skins of the Belly, they make a sort of Diversion in the Course of the

L

Spirits,

Spirits, and thereby give the Patient a lit-

tle Ease for the while.

The drawing away of the Winds with an empty Seringe, mention'd by Hippocrates and some of the Antients, can hardly be of any advantage; for whilst the Caufe remains, which it cannot remove, more Winds will arise; wherefore I should absolutely never advise it in Cholicks occasion'd by the Wind. Nor indeed have I ever order'd it my self in any case whatsoever; but am certainly inform'd that a celebrated Physician who died in London about fix Years ago, being habitually troubled with a violent Cholick, found great Benefit by this Pumping; and having taken both Purging Clysters, Potions and Pills, was oblig'd to use frequently the Empty Seringe, before any Evacuation would ensue; and that he not only us'd it himself for many Years, but often prescrib'd it successfully to o thers. And it seems reasonable, that where the Peristaltick motion of the Guts is either deficient or weak, it may afford great relief by emptying the Rectum and part of the Colon.

#### SECT. IV.

The Cure of the Cholick occasion'd by Crudities and Indigestions of an Acid Nature.

THE Indications in the Cure of Cholicks arising from this Cause are, to dissolve and attenuate the fix't Acids into lesser Particles; to evacuate and carry off the Indigested Aliments from the Stomach and Guts; and to prevent or remedy that Thickness and Coagulation of the Bload, which fixt Acid Humours produce. To which ends it will be sometimes proper to Bleed the Patient, to wir. when a Syncope or Suffocation (which often ensue from the Coagulation by the Blood) is apprehended, and the Physician finds by the Pulse that he is able to bear it. A Offer may be also given, tho' not so absolutely necessary in this, as in Cholicks proceeding from most other Causes, but Purges ought always to us'd much sooner here. It will be generally convenient to give a Vomit at the beginning, and that of a little stronger Nature than in the foregoing Cause. Oyland Tepid Water, or Fat-broth, may be first try'd; but if they are not sufficient to make a pretty good discharge, an nfusion of Carduus Benedictus or Ipecacuan.

gr. xii. must be given; and the following draught, one or two Hours after the Vomit has done working.

Reparation Rugloss and Fij. Corall. rubr. ocul. Cancror. praparat. Cortic, Peruvian. pulverisat. an Iss. Sal. Armoniac. Iss. misc. fiathaustus, cui, (si dolor si atrox) adde Laudan. opiat. dissolut. gr. j. vel gr. iss. miscentur hic volatilia cum fixis, ut prasto sint tam qua attenuent, quam qua absorbeant diversa indolis & natura materias, & ut sanguis animetur; Pulsus enim hic est Concentratus.

Having thus prepar'd the Humours, they are to be purg'd off the next Day, to which end,

Re Fol. senn. Ziij. Rhabarb. Zj. Sal. Tartar. Zs. infund. calide in aq. font. q. s. Colatur. dissolv. Man. Zj. Falap. gr. xv. vel Diagrid. gr. vj. misc. siat Potio sumend. mane cum regimine.

We order stronger Purges here, because a greater discharge is requisite, and we give them sooner, because the Cause shewing itself at the beginning, (by the Belching and Vomiting, and sometimes by a Loosness) to lye in the Guts and Stomach, the speediest Method to effect the Cure will

will be to discharge those Matters, before they enter into, and affect the Blood; and there is little or no danger here of promoting thereby a discharge of Humours upon any Part; because the Cause is not furnish'd from the Blood, but resides in the Indigested Aliments contain'd in the first ways, consequently by Purging we both remedy the present Symptoms, and prevent their encrease; and as Purges evacuate both from the Stomach and all the Guts, they are preferable here to Clysters, which reach only to some part of the Latter. After the Purge repeat the former Julep that Night, and the next Morning, and continue its use twice in 24 Hours at proper times, for two or three Days; then give Cortic. Peruvian. for five or fix Days in the same manner as for an Ague, thereby to absorbe the fixt Acids, help the Digestion, and prevent the Returns of the The Humours being of a fixt Cholick. Nature, Laudanum is to be given more sparingly, and not so soon here, as in Cholicks from other Causes, unless the Pains are violent, in which Case it is always to be given immediately.

When the Indigestions are Stercorous, and accompanied with a Loosness to which is join'd a violent Pain in the Belly resembling a Cholick; the Cure is to be that of a Diarrhaa, only more Laudanum is to

be

e d

19

L 3

be given in Proportion to the Pain. These are all the Alterations in this Cause from the Cure of the Cholick in general. The Symptoms and Signs by which this Cause is distinguish'd from others are deliver'd Pag. 103. and its Prognosticks Pag. 119.

### SECT. V.

The Cure of the Cholick occasion'd by the overflowing of the Gall; or, by Acrimonious and Corroding Juices.

THE Indications of the Cure from these Causes are; First, To allay the violence of the Pain by Anodins and Narcoticks: Secondly, To prevent Inflammations by Bleeding, and other Remedies proper for that Purpose, mention'd in the first Section of the Cure. Thirdly, correct the Acrimony and corrofive Irritation of the Humours; either by dividing their Salts into lesser Particles, which Attenuants and Dissolvents will effect; or by sheathing their Points in Alkaline and Abforbent Remedies; either of which will lessen the Violence of their Action. Fourthly, To evacuate those Humours thus prepared. Fiftbly, To correct and sweeten the Blood, when the Fit is over, thereby to

prevent

prevent its return. To these Ends Bleeding is first to be order'd; and this, or the
like Clyster some Hours after it.

Re Ser. Last. Hj. in quo dissolv. Pulp. Cass. recenter extrast. Ziss. Sal. Prunel. Zij. vel iij. misc. siat Enem.

If the Patient be fick at his Stomach, (which in Cholicks from these Causes, generally proceeds from the overflowing of the Gall into it) Vomit him with Oyl and luke-warm Water; or with weak and fat Broth: But all stronger Vomits are carefully to be avoided, least you thereby turn the Course of the Humours upwards, and change the Cholick into an Iliack Passion: Laudanum must be given the first Night, or sooner if the Pains be violent. After which, especially if it be in hot Weather, make the Patient drink a great quantity of cold Spring Water. For as Sylvius observes, nothing corrects the Acrimony of the Gall like to the Spirit of Nitre; now in cold Spring Water there is much refin'd Nitre, which will answer that Indication; and the great quantity of Liquid will both dissolve the Acrimonious Salts of the Gall, or of the Corrosive Humours, Relax the Fibres, and cool the Parts. Nor ought this Practice to be flighted, because casie, and without any Pomp of Reme-LA dies,

### The Cure of

dies, whose Properties are unknown to the Patient; for it has been often us'd with great Success, and is much Recommended by Galen (a.). Paulus Ægineta (b.) Fo. restus (c.) Amatus (d.) Septalius (e.) Fortis (f.) Zacutus, Riverius, Chirac, Barbeyrac, and

(

(

(a.) Galenus lib. 12. Meth. cap. 7.

(b.) Medicus quidem in Italia curavit Colicam victus quadam ratione infideli, refrigerante, & maxime temera. ria; Lactutas enim non coctas, refrigerantesque ipsis por rigebat, Intybumque similiter supra satietatem commeden. dum; item Uvas, Mala, Pisces durâ carne preditos, om. niaque crustacea, Pedes Bubulos, Bulbos, & similia, non solum facultate sed & taclu frigida; vinum raro prabebat, cum autem dabat frigida miscebat, ipsamque frigidam, vel etiam Poscam frigidam exhibebat, ab omni calido en medio cibo abstinens; atque plurimos sic prater omnium opinionem sanavit; imo nonnullos qui in morbum Comitialem vel Resolutionem prolapsi erunt, propemodum sanitati restituit. Paulus Ægineta lib. 3. cap. 14.

Tho' this Practice is so much inveigh'd against by Ægineta, I take the Quotation to make for my Affertion; for the extraordinary Success that Physician is own'd to have met with by it, is a sufficient Recommendation of it; and the succeeding Experiences of many able Men convince us, that a cold Regimen is beneficial in Cholicks from this Cause. And tho' some of his Prescriptions, especially that of eating more than the Stomach craves for, may be rash; yet the Method in the main, of giving Cooling Things, as boyl'd Lettice, or Endive, roasted Apples, cold Water, and the Abstinence from Wine, is not only allowable, but of great

Advantage.

(c.) In Colica Biliosa, frigida Aqua usus sum in iis quorum vires robustus & partes principales illasas deprehendi: ac scio me levasse omnino dolores & totum morbum ne reverteretur probibuisse. And. Dedi filio Falconis in Colica a causa calida Aquam gelidam; insuper Linteum Aqua frigida

and many other great Men. Yet Note carefully, that this Practice is never to be made use of, but in Persons of a sound Habit of Body; nor even in those without the Advice of a judicious Physician: For it is no easie Matter to distinguish rightly when 'tis proper, and if us'd otherwise it may prove very Prejudicial.

To those who are apprehensive of, or unwilling to take cold Water alone, its Use may be supply'd by some one of the

following Prescriptions.

Re Decoët. Lactuc. vel Acetos. part. iij. 1

The Cure of Cholick occasion'd by the Alteration of the Gall into what Physicians call Atrabile.

THE Indications for the Cure differ 1 very little in this Cause from the Preceding, only that we are to Bleed oftner, when the Pulse will bear it, because Inflammations are more frequent and dangerous here. It is carefully to be noted, that whenever the Pulse is so much concentrated, that you can scarce perceive any Motion in it, then you are never to bleed upon any account whatfoever. For by Bleeding in such case you may occasion a Syncope, or perhaps immediate Death. And in all Cases, where 'tis judg'd absolutely necessary to bleed whilst the Pulse is low, the Physician ought to keep his Finger upon the Patient's Pulse all the time he is bleeding, and order the

# The Cure of

Ligature to be loos'd the moment the Pulse is low.

Laudanum must be often repeated, and given in larger Doses in this Cause. The Clysters for the most part ought to be compos'd of cooling Oyls and Milk. The eating of as much Oyl as will agree with the Patient's Stomach, Milk also for common Food, are very beneficial here. Asses Milk upon the declining of the Fit, and for a Month or six Weeks after, is of vast advantage, both to perfect the Cure, and to prevent the return of the Distemper. Jesuits Bark is also a good Remedy. For the rest, this Cholick, when 'tis obstinate, and does not yield to these Remedies, is to be treated like the Cholera Morbus.

#### SECT. VII.

The Cure of the Cholick occasion'd by the Gall's penetrating, and insinuating itself into the Coats of the Guts, Stomach, and other Parts of the Lower Belly.

THE chief Indication in this Cause is to prevent Inflammations which are here very frequent and dangerous, wherefore Bleeding must be often repeated; and

Remedies proper to the Cure of a Bilious Cholick have generally preceded, before the Physician has grounds to suspect,
at least sufficient Proofs to conclude, the
Existence of this Cause'; no alteration from
the Cure of Bilious Cholick is to be made,
till by its not yielding to usual Remedies,
and by the Presence of the Symptoms enumerated, pag. 107, this is suspected. Then
the only Addition, in my Opinion to be
made, is the use of gentle Steel. Strong
Steel, or even the common most moderate
Preparations of it, will heat too much.

R. Rubigin. Ferri (rore maiali vel succo pomor. acidulor. induct.) pulverisat; & nodul. linteo laxé inclus. Ziij. Affund. Aq. font. fervent. thiv. stent. ad refriger. & infund. per bor 24° colatur. capiat zvj. vel viij. bis in die per viij. vel ix. dies.

I know the use of Steel is not a common Practice in Fits of the Cholick; I believe many will exclaim against it as an Innovation upon usual and established Methods; and perchance some may oppose it, as rash, prejudicial and contrary to all Practice. It may be particularly objected against it, that it Heats, and therefore is of all things to be avoided in this Distemper, wherein hot Remedies are generally noxious, but more especially in this Cause.

To which I answer, that no one is more averse to heating Remedies in the Cholick than my self, that I know very well all the common Preparations of Steel have that effect, and are therefore improper during the Fits; but this Preparation of it is not heating, and my own Experience convinces me, that it has entirely cured several in eight or ten Days, who had inessed in eight or ten Days, who had inessed for Months and Years. It not only cur'd the Fits, but prevented their Return; and I doubt not, but that others who are pleased to try it will find the same Essects.

The Confiderations which led me into this Practice were, that when this Cause is suspected or discover'd, the usual Method is, to order Narcoticks, Anodins and Coolers to allay the Pain and Heat, and to repeat Purges, thereby to Discharge the Humours from the Part affected. first making no Discharge of the Humour from the Part, can only appeale the Pain for a time, but never effect the Cure; and the latter can hardly reach it, so as to occasion a total Discharge, its obstinate continuance, and frequent returns for Years after repeated Purges, is a sufficient proof Add that Purges constantly occasion a greater Separation of the Gall into the Guts, whereby 'tis probable, that

more

more of it will be imbib'd into those parts of them, into which it had penetrated before. Wherefore no Method seem'd so proper as such a one, which by gently Dividing and Attenuating its Particles, could cause it to be gradual'y remixt with the Blood. This Steel effects, and given in this manner (which for the most part rather Cools than Heats) it entirely answers the Indication, and has seldom, in my Practice, mist the Cure, without any Inconvenience.

### SECT. VIII.

The Cure of the Cholick occasion'd by Sharp or Sow'r Humours difcharg'd foom the Blood upon the Guts, Stomach, or other Parts of the Lower Belly.

THE Indications here are, to allay the Pain; to carry off the present, and to prevent greater Discharges of the Humours. Bleeding is seldom necessary in this Cause, because the Humours being of an Acid Nature, don't greatly threaten Inflammations. Purges are not to be given

given at the beginning, as Galen (a) observes, because as they bring down a greater Discharge of Humours from the Blood upon the Guts, they would consequently encrease the Evil; nay, even the gentlest Clysters augment it: Wherefore the frequent use of Laudanum, and a thickening Diet, with Absorbent Juleps of Corral, Crabs Eyes, Jesuits Bark, &c. ought to be the only Med'cines for the three or four first Days. Anodins and Narcoticks alone, are the chief, and generally sufficient Remedies. Tho' what the Patient Vomits up should be Green, which is the worst Colour the Humours can have, stronger Vomits than luke warm Water and Oyl, or fat weak Broth, are never to be given in the Cholick arising from these Causes; for if, by a Vomit, you should procure a Discharge of ever so much greenish Humours to Day, the Stomach will be loaded with as much or more to morrow, separated there in greater quantity by the A. ction of the Vomit.

Galen. lib. 1. Apkor. 4. cui merito addi potest quam ex secretione ab illistfactà sequitur detrimentum.

Gentle Purges are to be given about the fifth or fixth Day, that is, when the Pain and Irritation are well allay'd, but not before as Galen instructs us (a). The following Case in Galen (b) is worth Observation, and his Method Instructive.

Atalius, a Youth subject to the Cholick, was much purg'd by the Juice of Scammony, the third Day after it he takes Cold, and had many Stools with sharp Pains; the fourth Day the Pains in his Belly encreafing, he took a Clyster ex ol. Rutac. by which the Pains grew violent, and a great Looseness succeeded. This Galen took for an evident fign, that some Humours were discharg'd from the Blood upon the Parts of the Lower Belly, which he attributed to the use of Scammony, that had made a Defluxion chiefly upon those Guts which were weak before. He order'd his Patient Alica and Pomegranate Seeds boyl'd together in Spring Water, a Dissolution of Sumach for his Drink, Bread alone dipp'd in old rough Wine, and Astringent Fruits, as M 2 Pears,

### SECT. IX.

The Cure of the Cholick occasion'd by Corrosive Humours discharg'd from the Blood.

THE Indications for the Cure in this Cause, are, 1st, To Mitigate the Violence of the Pain; 2dly, To Prevent Inflammations, Erosions and Ulcers; 3dly, To correct and carry off what Humours are already separated upon the Parts, and to prevent any farther discharge of them. Lastly, to remedy the Disorder in the Blood, and thereby prevent any return of the Fits.

e

The beginning of the Cure is to be entirely the same with that of the Over-swing of the Gall deliver'd in Sect. 5. Cooling Remedies, Anodins, Narcoticks, Sweetners and Incrassants, are some or all of them to be order'd, and often repeated. Upon the decline of the Fit, Mineral Waters, or a Milk Diet, after the Body is prepared for it, one of the two, are never to be omitted. As the gnawing Irritation of the Stomach is very troublesome, the Patient must be allow'd to eat often; but of Meats that are cooling, thickning, and of easie Digestion. All heating things,

whether Food or Medecines, must be

carefully refrain'd from. (a)

The following Case is very remarkable, and no doubt many of the like Nature would be met with, if Dissections were more frequent. A very fat Man who had been afflicted with the Cholick four Years, and treated with all proper Remedies ineffectually, fell at last into a Marasme or the Extenuation of his whole Body, and died. Being opened, all the Parts were found entire and found, only he had no Gall-Bladder. Upon dissetting his Guts, the Surgeon's Fingers were perfectly excoriated, or flead, by the sharp corrosive 'Tis to be Humour that was in them. noted, that this Man had been long subject to a Rheumatism, which left him so soon as the Cholick seiz'd him; an evident fign, that the Humour of the Rheumatism was translated, and thrown upon the Guts, to cause the Cholick; so that it was properly a violent Rheumatism of I was present my self at this the Guts. Dissection in Montpellier, and receiv'd this Account

<sup>(</sup>a) Vidi hominem a calidis tum cibis tum medicamentis, atque ab omni calorificà victus ratione irritari, rursus juvari a temperatis, insuper inediam ei noxam inferre; sensus doloris erat mordax, unde conjeci mordacem humorem ad affecti intestini tunicas defluxisse. Galen lib. 1. de loc. affect. cap. 4.

Account of what had preceded it from the Deceased's Physicians.

### SECT. X.

The Cure of the Cholick occasion'd by the Translation of the Humours of the Gout, Scurvy, Rheumatism, Venerial Distempers, &c. upon the Guts, or other Parts of the Lower Belly.

THE Indications and Method of the Cure in these Cases, are in general much the same as in the Sections, V, VIII and IX. but when the Cholick evidently proceeds from a Translation of the Goutish Humour upon the Guts, or other Parts of the Lower Belly, you must endeavour to throw it out into the Extremities, treating the Patient like one actually seiz'd with a Fit of the Gout in his Stomach, only that strengthning and repelling Clysters are to be added, and chiefly insisted upon, when this Cholick is judged to reside in the Guts themselves.

If the Cholick proceeds from a Rheumatick Humour translated upon any Parts of M 4 the would do one in a Rheumatism, with small regard to the Cholick, except the ordering of Repelling Clysters to remove the Humour from the Guts, it being less dan-

gerous in the Muscles.

When the Cholick arises from Venerial Causes, it can be cured only by Mercurial Medecines, all other Remedies will prove ineffectual. When it proceeds from the Scurvy, no Alteration from the Cure of the Cholick in general is requisite, except only giving Antiscorbuticks by Intervals.

### SECT. XI.

The Cure of the Cholick occasion a by Obstruction and Swelling of the Glands of the Guts.

THE Indications and Method for the Cure during the Paroxism, are the same in this Cause, as deliver'd in the Cure of the Cholick in general, Sect. 1-When the Paroxism is ended a Steel Course will be necessary, to remove those Obstructions, which may otherways end in Suppurations or Ulcers. Strong Steel is carefully to be avoided, for by Heating too much,

fidential for this

muc

Fit,

para mod whi ble

exce

The

T

be p Nar ter

toe

much, it would cause the Return of the Fit, and consequently interrupt the Continuance of the Steel Course before any considerable Advancement can be made towards the Removal of the Cause. It may also occasion an immediate Suppuration or Ulcer, which 'tis the chief Indication to prevent. Wherefore we must always in this Cause begin with extream weak Preparations of Steel, augment them by almost insensible degrees, and continue their moderate use for two or three Months; which may be done with very little trouble to the Patient, and without hindrance of Business. Aperitive Mineral Waters are excellent in this Case.

### SECT. XII.

The Cure of the Cholick occasioned by a thick viscous, white Matter, term'd Pituitous and Cold by the Antients.

THE chief Indications here are, to allay the violence of the Pain, which may be performed by the use of Anodins and Narcoticks; to disengage the Viscous Matter from its adherence to the Guts, and to evacuate it out of the Body, both which may

may be effected by Clysters, Purges, and other Remedies hereafter mention'd.

The two or three first Clysters must be made of Fat weak Broth, Butter, and Oyls, for nothing Incorporates its self with, and dissolves viscous glewy Humours, like greafie and oily Substances. To the following Clysters it will be proper to add some Oil of a more subtile penetrating Quality, such as Ol. Sabin. Laurin. Rutac. vel Corn. Cerv. in quo Ruta fuerit Cocta, to dissolve and attenuate the viscous Humours still more; for they adhere very Obstinately, and require much Preparation to be disengag'd: Clysters compos'd with these latter Oils sometimes cure this Cholick immediately; but if they have not the defired Effect, add to some one of the former Prescriptions Aq. Benedict. Ruland. 3j. vel jj. or Vin. Emetic. Ziv. or Injiciantur Enemat. Antimonial. a Riverio & Sennerto Proposit. que optime conveniunt in urgenti Casu. or R Vin. Hippocrat. Hj. injiciatur pro Enemat. Sanavit. nonnullos in momento.

Soon after the Operation of the Clysters, give these or the like Remedies inwardly, to prepare the Humours for Evacuation.

I am apt to think, that if ever Cucurbitula cum magna flamma can be of Use, tis in this Cause. For it seems reasonable and conform to the Experience of outward Matters, that as the Heat of Fire dissolves Glew, and thereby loosens it from its close and strict adherence to other Bodies; so this Heat may dissolve those viscous tenacious Humours, and thereby disengage them from their Adherence to the Guts, whereby the Pain may possibly be cas'd in a Moment, as Galen and others affirm. As I never have try'd it, I cannot answer for the Truth of the Fact, but only deliver thus my own Thoughts of it. As Heat

Heat destroys the Spring and Elasticity of common Air, I will not deny but it may have the same Effect on the Winds contain'd within the Guts, which are an exalted Air arising from ill-digested Aliments, and consequently that Cucurbitula cum magna slamma, may here possibly give some Ease for a short time. But the Effect of that Heat ceasing, those Winds will soon recover the Strength of their sormer Elasticity, whereby the Pains will return, so that this Method can never produce an absolute Cure.

### SECT. XIII.

The Cure of the Cholick occasion'd by Inflammations.

THE chief Indications here are, to allay the Violenee of the Pain; to prevent the continuance and encrease of, and lessen the present Imstammation; wherefore we must Bleed more frequently, and in larger quantities, Prescribe more and larger Doses of Narcoticks and Anodine Clysters; shun absolutely all heating things, and insist on cooling Medecins, as Spirit. This Clyster taken soon after the Purge (which, and the foregoing Remedies, generally make the Worms sick, and draw them low down) smothers them in the Oil, and disengaging them from their adherence to the Guts by the violent Action of the Emetick, and brings them away by Stools.

Aloes is a very good Purge in this Case. Its bitterness kills the Worms, and it both corroborates and evacuates, as Galen and others observe (a). Paracelsus (b) says that Hypericon apply'd to the part opposite to that place where the Worms lie, will make them remove their fituation, confequently would be of use when they adhere obstinately to any part of the Guts; but I will not answer for the Fact which I have never try'd. This Cause ought to be always carefully examin'd into, being more frequent even in adult Persons, than is commonly imagin'd, and many by the neglect of a Cure for it in time, have died Convulfive, or have been eaten thro' by Worms,

(a) Galenus in lib. Simplic. Diascorides lib. 3. cap. 23. Mesue. cap. 1. Simplic.

(b) Paracelsus lib. de Lumbricis.

as several Authors testifie. (a). The following Cases are remarkable. Two Girls, one of Seven, the other Nine Years old, were seized with most violent Cholicks, and insupportable Pains in their Bellies, which no Clysters, Purges or Worm Medecines could appeare. The eldest being Dead, was open'd, whereby Worms were discover'd, which had gnaw'd Holes quite thro' several Places of her Guts, especially thro' the Colon. The younger dying afterwards, and being likewise disfected, they found not only Holes eat quite thro' her Guts by the Worms, but that they had also gnaw'd themselves Nests in her very Heart and Liver. Riverius (b). Another Girl of 14 Years of Age was troubled with most violent Pains of the Cholick, accompanied with a Fever and Syncope. Anodins, Carminative Clysters, and Purges were prescrib'd, by all which she receiv'd no relief; at last a Clyster of Milk warm from the Cow was order'd, which brought away by Stool above seventy Worms so entangled and

### The Cure of

and twisted together, in a round Ball as big as a Man's Fist, that it was hardly possible to separate them; whereupon the Pains and other Symptoms immediately ceased, and she was perfectly cur'd. Fabritius (a).

### SECT. XV.

The Cure of the Cholick occasioned by Stones in the Guts, Gall-bladder, or Stomach.

THE Indications for the Cure in this Cause are, 1st, To allay the Violence of the Pain, which Narcoticks answer. 2dly, To prevent Inflammations by Bleeding. 3dly, To bring away the Stones where practicable, which last is a very difficult Undertaking.

Stones in the Stomach are scarce possible to be discharg'd by any other means than by Vomits, and very seldom that way, tho' some Instances of it are related by

Authors (b).

When

te

te

th

of

C

cio

try

no

be

per

ho

fio

ed

lar

me

fre

<sup>(</sup>a) Fabritius Hildanus Cent. 1. observ. 12

<sup>(</sup>b) Idem Cent. 5, observ. 57.

When a Stone is suspected to lie in the Guts, and not to be adherent, great quantities of Oil swallowed, and given in Clysters, is the most likely method to bring it away, by lubricating the Parts, and making a slippery Passage for it. After that Globul. Plumb. may be swallowed, to drive it out of the Body, but not unless there are almost evident Signs of its being loose, for otherwise the Stone may fix the Bullet, and make a greater stop-

page in the Guts.

a

C

n

y

n

When a Stone is judged to be in the Gall-bladder, the strongest Aperitives, Steel Medecines, and Mineral Steel Waters, in large quantities are to be taken, to endeavour the removal of it from thence into the Guts, which has been often effected by their use, and an entire Cure ensued. But if after what a judicious Physician shall account a competent tryal of them, this effect is not produced, nor any Symptoms appear of the Stones being remov'd lower (which if it happens, they ought to be continued, in hopes of its farther Descent, and Exclusion in the end) they are not to be insisted upon. For where the Stones are too large to be brought away, forcing Remedies will render the Paroxisms more frequent, if not continual, during their N 2 use,

use, and thereby aggravate the E-vil.

### SECT. XVI.

The Cure of Cholicks occasioned by Wounds, Imposthumes, Ulcers, Ruptures, Cancers; by the Adhesion, or Præternatural Position of Parts, by a Caries, by an Excrescence or Inversion of the Cartilago Ensiformis; or proceeding from Habitual Colds, or sudden Passions.

ji fo

01

tc

V

Cr

pı ct

V

W

HEN the Cholick is known to proceed from Wounds, Imposthumes, Ulcers, or Ruptures, we must first endeavour the Cure of those particular Ailments by proper Remedies; till that is effected, it will be in vain to hope for the entire removal of the Cholical Pains, which in these Cases are but Symptomatical.

When the Cholick proceeds from an inward Cancer, there is no Cure possible. Lenitives, Anodins and Narcoticks are the only Medecines of any use, and all these

these can do is to render the Pains more

supportable.

When the Cholick is occasion'd by the Præternatural Position of any of the inward Parts, by their Adhesion or growing together, or from Callosities in them; there is no entire Cure to be had, tho' the Paroxisms may often be remov'd by Remedies in Sect. 1.

When we have cause to believe that the Cholick arises from a Caries in some particular Bone (which 'tis almost impossible to be certain of till after Death) the only Remedy is to lay the Bone o-

pen.

)

1

t

r

S,

-

n

e.

re

11

Se

When the Pains of the Cholick are judged to proceed from a Bony Excrescence or Inversion of the Cartilago Ensiformis, (which is a Case mentioned by good Authors, but what I never met with, nor have read any Cure for) the only Remedy I can think of, would be to open the Skins, and to cut off the inverted part of that Cartilage, or its Excrescence; nor can I apprehend any ill Consequence from it, though it is what probably has never yet been put in Pracetice.

In Cholicks that are Habitual from every little Cold or sudden Passion, the weak Disposition of the Body and the N 3 Blood

Blood is to be remedied by constant Riding, Cold Baths, German Spaw Waters, &c. As these Fits usually go off themselves in a few Hours, no Remedies are necessary to the Cure of the Paroxisms; or if any, Narcoticks alone generally effect it, which if they should not, you must then proceed to the Cure of the Cholick mention'd in Sect. 1.

### SECT. XVII.

Remedies particularly recommended by various Authors.

I Have thought fit to annex the following Receipts to this Treatife, that Physicians having at hand a view of all sorts of Remedies recommended by our Predecessors in that Science, may chuse out of them what they shall judge best indicated in desperate Cases, where 'tis better to hazard a doubtful Remedy, than to let the Patient die without attempting his Recovery; according to these Axioms of Hippocrates and Galen. Melius est anceps Remedium quam nullum.

### The Cure, &c.

A Load-stone apply'd to the Navel, by which 'tis pretended by Hartmannus that Cholical Pains will immediately cease.

Another very expensive Cheat is Water made bitter by the Insusion of a Stone found within a *Porcupine*, and extoll'd by some as an infallible Remedy.

All these, and the like pretended

Charms, are entirely useless.
